## Foreword

Education is a process of human enlightenment and empowerment. Recognizing the enormous potential of education, all progressive societies have committed to the Universalization of Elementary Education with an explicit aim of providing quality education to all. As the next step, universalization of Secondary Education has gained momentum.

The secondary stage marks the beginning of the transition from functional mathematics studied upto the upper primary stage to the study of mathematics as a discipline. The logical proofs of propositions, theorems etc. are introduced at this stage. Apart from being a specific subject, it is to be treated as a concomitant to every subject involving analysis as reasoning.

I am confident that the children in our state of Telangana learn to enjoy mathematics, make mathematics a part of their life experience, pose and solve meaningful problems, understand the basic structure of mathematics by reading this text book.

For teachers, to understand and absorb critical issues on curricular and pedagogic perspectives duly focusing on learning rather than of marks, is the need of the hour. Also coping with a mixed class room environment is essentially required for effective transaction of curriculum in teaching learning process. Nurturing class room culture to inculcate positive interest among children with difference in opinions and presumptions of life style, to infuse life in to knowledge is a thrust in the teaching job.

The afore said vision of mathematics teaching presented in State Curriculum Frame work (SCF-2011) has been elaborated in its mathematics position paper which also clearly lays down the academic standards of mathematics teaching in the state. The text books make an attempt to concretize all the sentiments. In the endeavor to continuously improve the quality of our work, we welcome comments and suggestions in this regard.

With an intention to help the students to improve their understanding skills in both the languages i.e. English and Telugu, the Government of Telangana has redesigned this book as bilingual textbook in two parts. Part-1 comprises 1 to 8 lessons/ chapters and Part- 2 comprises 9 to 15 lessons/ chapters.

The State Council for Education Research and Training, Telangana appreciates the hard work of the text book development committee and several teachers from all over the state who have contributed to the development of this text book at different levels. I am thankful to the District Educational Officers, Mandal Educational Officers and Head teachers for making this mission possible. I also thank the institutions and organizations which have given their time in the development of this text book. I am grateful to the office of the Commissioner \& Director of School Education, (T.S.) and Vidya Bhawan Society, Udaipur, Rajasthan for extending cooperation in developing this text book. Our special thanks to Faculty of School of Education Tata Institute of Social Sciences (TISS), Hyderabad and Sri Ramesh Khade, Communication Officer, CETE, TISS-Mumbai and Designers identified by SCERT for their technical support in redesigning of the textbooks.

## PLEDGE

"India is my country; all Indians are my brothers and sisters. I love my country, and I am proud of its rich and varied heritage.

I shall always strive to be worthy of it.
I shall give my parents, teachers and all elders respect, and treat everyone with courtesy. I shall be kind to animals.

To my country and my people, I pledge my devotion.
In their well-being and prosperity alone, lies my happiness."

- Pydimarri Venkata Subba Rao

Government's Gift for Students' Progress

### 1.0 Introduction

We start learning numbers like $1,2,3,4 \ldots$ for counting objects around us. These numbers are called counting numbers or natural numbers.
(i) Which is the smallest natural number?
(ii) Write any five natural numbers between 100 and 10000 .
(iii) Can you tell the last number in the sequence of natural numbers?

(iv) What is the difference between any two consecutive natural numbers?

By including ' 0 ' to the collection of natural numbers, we get a new collection of numbers called whole numbers i.e., $0,1,2,3,4, \ldots \ldots$.

In class VI we also learnt about negative numbers. If we put whole number and negative numbers together we get a bigger collection of numbers called integers. In this chapter, we will learn more about integers, their operations and properties.

Let us observe how to represent some integers on a number line.

(i) Which is the biggest integer represented on the above number line?
(ii) Which is the smallest integer represented on the above number line?
(iii) Is 1 bigger than -3 ? Why?
(iv) Is -6 bigger than -3 ? Why?
(v) Arrange 4, 6, -2, 0 and -5 in ascending order.
(vi) Compare the difference between $(0,1)$ and $(0,-1)$ using the number line.

## Exercise - 1.1

1. Some integers are circled on the number line. Write the biggest and the smallest numbers?

2. Write all the integers between the pairs of integers given below. Also, choose the biggest and smallest intergers from them.
(i) $-5,-10$
(ii) $3,-2$
(iii) $-8,5$
3. Write the following integers in ascending order (smallest to biggest).
(i) $-5,2,1,-8$
(ii) $-4,-3,-5,2$
(iii) $-10,-15,-7$
4. Write the following integers in descending order (biggest to smallest).
(i) $-2,-3,-5$
(ii) $-8,-2,-1$
(iii) $5,8,-2$
5. Represent $6,-4,0$ and 4 on a number line.
6. Fill the missing integers on the number line given below

7. The temperatures (in degrees celsius/centigrade) of 5 cities in India on a particular day are shown on the number line below.

Write the answers for the following questions based on the above number line.
(i) Write the temperatures of the cities marked on it?
(ii) Which city has the highest temperature?
(iii) Which city has the lowest temperature?
(iv) Which cities have temperature less than $0^{\circ} \mathrm{C}$ ?
(v) Which cities have temperature more than $0^{\circ} \mathrm{C}$ ?

### 1.1 Operations of integers

We have learnt about addition and subtraction of integers in class VI. First we will review our understanding of the same and then learn about multiplication and division of integers.

### 1.1.1 Addition of integers

Observe the additions given below.

$$
\begin{aligned}
& 4+3=7 \\
& 4+2=6 \\
& 4+1=5 \\
& 4+0=4 \\
& 4+(-1)=3 \\
& 4+(-2)=2 \\
& 4+(-3)=1
\end{aligned}
$$

Do you find any pattern in the answers? You will find that when the number being added to 4 is decreased by one $(3,2,1,0,-1,-2,-3)$ then the value of the sum also decreases by 1 .

On the number line, when you add 3 to 4 you move 3 steps right from 4 on the number line.

Similarly, what will happen if you add 2 and 1 to 4 on the number line drawn above? You will find that in each case you have moved right on the number line.

Now, let us see what is happening when we add -1 to 4 . From the above pattern, $4+(-1)=3$. We understand that we have to move one step left on the number line.

Similarly, what will happen if you add -2 and -3 to 4 on the number line drawn above? You will find that in each case you are moving left on the number line.

Thus, each time you add a positive integer you move right on the number line. On the other hand, each time you add a negative number you move left on the number line.

(i) Represent the additions $9+2,9+(-1), 9+(-3),(-1)+2,(-3)-5$ on the number line.
(ii) When you add a positive integer to a number, in which direction did you move on the number line?
(iii) When you add a negative integer to a number, in which direction did you move on the number line?
2. Sangeetha said that each time you add two integers, the value of the sum is greater than the numbers. Do you agree with her? Give reasons for your answer.

## Exercise - 1.2

1. Represent the following additions on a number line.
(i) $5+7$
(ii) $5+2$
(iii) $5+(-2)$
(iv) $5+(-7)$
2. Compute the following.
(i) $7+4$
(ii) $8+(-3)$
(iii) $11+3$
(iv) $14+(-6)$
(v) $9+(-7)$
(vi) $14+(-10)$
(vii) $13+(-15)$
(viii) $4+(-4)$
(ix) $10+(-2)$
(x) $100+(-80)$
(xi) $225+(-145)$
(xii) $(-5)+7$
(xiii) $(-15)-(1)$
(xiv) $(-5)+(-3)$

### 1.1.2 Subtraction of integers

Now let us observe the subtractions given below.
$6-3=3$
$6-2=4$
$6-1=5$
$6-0=6$
$6-(-1)=7$
$6-(-2)=8$
$6-(-3)=9$
$6-(-4)=10$
Do you find any pattern in the answers? You will find that when the number being subtracted from 6 is decreased by one $(3,2,1,0,-1,-2,-3,-4)$ the value of the difference increased by 1 .
On the number line when you subtract 3 from 6, you move 3 steps left from 6 on the number line.

Similarly, if you subtract 2,1 from 6 on the number line. You will observe that in each case you have moved left on the number line.

Now, let us see what is happening when we subtract -1 from 6 . As seen from the above pattern we get $6-(-1)=7$.

Thus, we have moved one step right on the number line .

Similarly, what will happen if you subtract $-2,-3,-4$ from 6 ? You will find that in each case you are moving right on the number line.

Thus, each time you subtract a positive integer, you move left on the number line and each time you subtract a negative integer, you move right on the number line.
Complete the pattern given below.

| $1.8-6=2$ |  |
| ---: | :--- |
| $8-5$ | $=$ |
| $8-5$ |  |
| $8-4$ | $=$ |
| $8-3$ | $=$ |
| $8-2$ | $=$ |
| $8-1$ | $=$ |
| $8-0$ | $=$ |
| $8-(-1)$ | $=$ |
| $8-(-2)$ | $=$ |
| $8-(-3)$ | $=$ |
| $8-(-4)$ | $=$ |
| (i) Represent $8-6,8-1,8-0,8-(-2), 8-(-4)$ on the number line. |  |

(ii) When you subtract a positive integer in which direction do you move on the
number line?
(iii) When you subtract a negative integer, in which direction do you move on the
number line?
Richa felt that each time you subtract an integer from another integer, the value of
the difference is less than the given two numbers. Do you agree with her? Give
reasons for your answer.

## Exercise - 1.3

1. Represent the following subtractions on the number line and write the result.
(i) 7-2
(ii) $8-(-7)$
(iii) $3-7$
(iv) $15-14$
(v) $5-(-8)$
(vi) $\quad(-2)-(-1)$
2. Compute the following.
(i) $17-(-14)$
(ii) $13-(-8)$
(iii) $19-(-5)$
(iv) $15-28$
(v) $25-33$
(vi) $80-(-50)$
(vii) 150-75
(viii) $32-(-18)$
(ix) $(-30)-(-25)$
3. Express ' -6 ' as the sum of a negative integer and a whole number.

### 1.1.3 Multiplication of integers

Now, let us multiply integers.
We know that $3+3+3+3=4 \times 3(4$ times 3$)$
This can be represented on the number line as follows:

Thus, $4 \times 3$ means 4 jumps each of 3 steps from zero towards right on the number line and therefore $4 \times 3=12$.

Now let us discuss $4 \times(-3)$ i.e., 4 times ( -3 )
$4 \times(-3)=(-3)+(-3)+(-3)+(-3)=-12$
This can be represented on the number line as follows:

Thus, $4 \times(-3)$ means 4 jumps each of 3 steps from zero towards left on the number line and therefore $4 \times(-3)=-12$

Similarly, $5 \times(-4)=(-4)+(-4)+(-4)+(-4)+(-4)=-20$
This can be represented on the number line as follows:

Thus, $5 \times-4$ means 5 jumps each of 4 steps from zero towards left on the number line and therefore $5 \times-4=-20$

Similarly, $2 \times-5=(-5)+(-5)=-10$

$$
\begin{aligned}
& 3 \times-6=(-6)+(-6)+(-6)=-18 \\
& 4 \times-8=(-8)+(-8)+(-8)+(-8)=-32
\end{aligned}
$$

## Do This

1. Compute the following.
(i) $2 \times-6$
(ii) $5 \times-4$
(iii) $9 \times-4$

Now, let us multiply $-\mathbf{4 \times 3}$
Observe the following pattern.

$$
\begin{aligned}
4 \times 3 & =12 \\
3 \times 3 & =9 \\
2 \times 3 & =6 \\
1 \times 3 & =3 \\
0 \times 3 & =0 \\
-1 \times 3 & =-3 \\
-2 \times 3 & =-6 \\
-3 \times 3 & =-9 \\
-4 \times 3 & =-12
\end{aligned}
$$

You see that as the multiplier decreases by 1 , the product decreases by 3 .
Thus, based on this pattern $-4 \times 3=-12$.
We already know that $4 \times-3=-12$
Thus, $-4 \times 3=4 \times-3=-12$
Using this pattern we can say that
$4 \times(-5)=(-4) \times 5=-20$
$2 \times(-5)=(-2) \times 5=-10$
$3 \times(-2)=$
$8 \times(-4)=$
$6 \times(-5)=$
From the above examples you would have noticed that product of positive integer and a negative integer is always a negative integer.

### 1.1.3(a) Multiplication of two negative integers

Let us see what we will get on multiplying -3 and -4 .
Observe the following pattern.

$$
\begin{aligned}
& -3 \times 4=-12 \\
& -3 \times 3=-9 \\
& -3 \times 2=-6 \\
& -3 \times 1=-3 \\
& -3 \times 0=0 \\
& -3 \times-1=3 \\
& -3 \times-2=6 \\
& -3 \times-3=9 \\
& -3 \times-4=12
\end{aligned}
$$

Do you observe any a pattern? You will see that as we multiply -3 by $4,3,2,1,0,-1,-2$, $-3,-4$ the product increases by 3 .

Now let us multiply -4 and -3 .
Observe the following products and fill the blanks.

$$
\begin{aligned}
& -4 \times 4=-16 \\
& -4 \times 3=-12 \\
& -4 \times 2=-8 \\
& -4 \times 1=-4 \\
& -4 \times 0=0 \\
& -4 \times-1=- \\
& -4 \times-2= \\
& -4 \times-3=
\end{aligned}
$$

You will see that as we multiply -4 by $4,3,2,1,0,-1,-2,-3$, the product increases by 4 .
According to the two patterns given above, $(-3) \times(-4)=(-4) \times(-3)=12$

You have also observed that.

$$
\begin{array}{ll}
-3 \times(-1)=3 & -4 \times(-1)=4 \\
-3 \times(-2)=6 & -4 \times(-2)=8 \\
-3 \times(-3)=9 & -4 \times(-3)=12
\end{array}
$$

Thus, every time if we multiply two negative integers, the product is always a positive integer.

## Activity 1

Fill the grid by multiplying each number in the first column with each number in the first row.

| $\times$ | 3 | 2 | 1 | 0 | -1 | -2 | -3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 9 | 6 | 3 | 0 | -3 | -6 | -9 |
| 2 | 6 | 4 | 2 | 0 |  |  |  |
| 1 |  |  |  |  |  |  |  |
| 0 |  |  |  |  |  |  |  |
| -1 | -3 | -2 | -1 | 0 | 1 | 2 | 3 |
| -2 |  |  |  |  |  |  |  |
| -3 |  |  |  |  |  |  |  |

(i) Is the product of two positive integers always a positive integer?
(ii) Is the product of two negative integers always a positive integer?
(iii) Is the product of a negative and positive integer always a negative integer?

### 1.1.3(b) Multiplication of more than two negative integers

We noticed that the product of two negative integers is a positive integer. What will be the product of three negative integers? Four negative integers? and so on .....

Let us observe the following examples.
(i) $\quad(-2) \times(-3)=6$
(ii) $(-2) \times(-3) \times(-4)=[(-2) \times(-3)] \times(-4)=6 \times(-4)=-24$
(iii) $\quad(-2) \times(-3) \times(-4) \times(-5)=[(-2) \times(-3) \times(-4)] \times(-5)=(-24) \times(-5)=120$
(iv) $[(-2) \times(-3) \times(-4) \times(-5) \times(-6)]=120 \times(-6)=-720$

From the above products, we observe that
(i) The product of two negative integers is a positive integer.
(ii) The product of three negative integers is a negative integer.
(iii) The product of four negative integers is a positive integer.
(iv) The product of five negative integers is a negative integer.

Is the product of six negative integers be positive or negative? State reasons.

## Try This

(a) $(-1) \times(-1)=$ $\qquad$
(b) $(-1) \times(-1) \times(-1)=$
(c) $(-1) \times(-1) \times(-1) \times(-1)=$
(d) $(-1) \times(-1) \times(-1) \times(-1) \times(-1)=$

We further see that in (a) and (c) above, the number of negative integers that are multiplied are even number of times and their products are positive integers. The number of negative integers that are multiplied in (b) and (d) are odd number of times and their products are negative integers.

Thus, we find that if the number of negative integers being multiplied is even, then the product is a positive integer. And if the number of negative integers being multiplied is odd, the product is a negative integer.

## Exercise - 1.4

1. Fill in the blanks.
(i) $(-100) \times(-6)=$
(ii) $(-3) \times \ldots \ldots \ldots . .=3$
(iii) $100 \times(-6)=$ $\qquad$
(iv) $(-20) \times(-10)=$ $\qquad$
(v) $15 \times(-3)=$ $\qquad$
2. Find each of the following products.
(i) $3 \times(-1)$
(ii) $(-1) \times 225$
(iii) $(-21) \times(-30)$
(iv) $(-316) \times(-1)$
(v) $(-15) \times 0 \times(-18)$
(vi) $(-12) \times(-11) \times(10)$
(vii) $9 \times(-3) \times(-6)$
(viii) $(-18) \times(-5) \times(-4)$
(ix) $(-1) \times(-2) \times(-3) \times 4$
(x) $\quad(-3) \times(-6) \times(-2) \times(-1)$
3. A certain freezing process requires that the room temperature be lowered from $40^{\circ} \mathrm{C}$ at the rate of $5^{\circ} \mathrm{C}$ every hour. What will be the room temperature 10 hours after the process begins?
4. In a class test containing 10 questions, ' 3 ' marks are awarded for every correct answer and ( -1 ) mark is for every incorrect answer and ' 0 ' for questions not attempted.
(i) Gopi gets 5 correct and 5 incorrect answers. What is his score?
(ii) Reshma gets 7 correct answers and 3 incorrect answers. What is her score?
(iii) Rashmi gets 3 correct and 4 incorrect answers out of seven questions she attempts. What is her score?
5. A merchant on selling rice earns a profit of `10 per bag of basmati rice sold and a loss of` 5 per bag of non-basmatirice.
(i) He sells 3,000 bags of basmati rice and 5,000 bags of non-basmatirice in a month. What is his
 profit or loss in a month?
(ii) If we sell 6,400 non-basmati rice, how many basmati rice bags are to be sold to get neither profit nor loss?
6. Fill in the blanks.
(i) $(-3) \times \longrightarrow=27$
(ii) $5 \times \longrightarrow=-35$
(iii) $\longrightarrow(-8)=-56$
(iv) $-\times(-12)=132$

### 1.1.4 Division of integers

We know that division is the inverse operation of multiplication. Let us observe some examples for natural numbers.

We know that $3 \times 5=15$
Therefore, $15 \div 5=3$ or $15 \div 3=5$
Similarly, $4 \times 3=12$
Therefore, $12 \div 4=3$ or $12 \div 3=4$
Thus, we can say that for each multiplication statement of natural numbers there are two corresponding division statements.
We can also write a multiplication statement and its corresponding division statements for integers?
Observe the following and complete the table.

| Multiplication statement | Division statements |  |  |
| :--- | :--- | :--- | :--- |
| $2 \times(-6)=(-12)$ | $(-12) \div(-6)=2 \quad$, | $(-12) \div 2=(-6)$ |  |
| $(-4) \times 5=(-20)$ | $(-20) \div(5)=(-4)$ | , | $(-20) \div(-4)=5$ |
| $(-8) \times(-9)=72$ | $72 \div(-8)=(-9)$ | , | $72 \div(-9)=(-8)$ |
| $(-3) \times(-7)=$ | $-(-3)=$ | , |  |
| $(-8) \times 4=$ |  |  |  |
| $5 \times(-9)=$ |  | , |  |
| $(-10) \times(-5)=$ |  |  |  |

We can infer from the above table that when we divide a negative integer by a positive integer or a positive integer by a negative integer, we divide them as whole numbers and then put a negative ( - ) sign for the quotient. We thus, get a negative integer as the quotient.

## Do This

1. Compute the following.
(i) $(-100) \div 5$
(ii) $(-81) \div 9$
(iii) $(-75) \div 5$
(iv) $(-32) \div 2$
(v) $125 \div(-25)$
(vi) $80 \div(-5)$
(vii) $64 \div(-16)$

## Try This

Can we say that $(-48) \div 8=48 \div(-8)$ ?
Check whether the following are true or not?
(i) $90 \div(-45)$ and $(-90) \div 45$
(ii) $\quad(-136) \div 4$ and $136 \div(-4)$

We also observe that
$(-12) \div(-6)=2 ;(-20) \div(-4)=5 ;(-32) \div(-8)=4 ;(-45) \div(-9)=5$
So, we can say that when we divide a negative integer by a negative integer, we get a positive number as the quotient.

## Do This

1. Compute the following.
(i) $-36 \div(-4)$
(ii) $(-201) \div(-3)$
(iii) $(-325) \div(-13)$

### 1.2 Properties of integers

In class VI we have learnt the properties of whole numbers. Here we will learn the properties of integers.

### 1.2.1 Properties of integers under addition <br> (i) Closure property

Observe the following additions and complete the table.

| Statement | Conclusion |
| :--- | :--- |
| $5+8=13$ | The sum is a whole number |
| $6+3=$ |  |
| $13+5=$ |  |
| $10+2=$ |  |
| $2+6=8$ | The sum is a whole number |

Is the sum of two whole numbers always a whole number? You will find this to be true. Thus, we say that whole numbers follow the closure property of addition.
Do integers satisfy closure property of addition? Observe the following additions and complete the blanks.

| Statement | Conclusion |
| :--- | :---: |
| $6+3=9$ | The sum is an integer |
| $-10+2=$ |  |
| $-3+0=$ |  |
| $-5+6=1$ |  |
| $(-2)+(-3)=-5$ |  |
| $7+(-6)=$ | The sum is an integer |

Is the sum of two integers always an integer?
Can you give an example of a pair of integers whose sum is not an integer? You will not be able to find such a pair. Therefore, integers are also closed under addition.

In general, for any two integers $a$ and $b, a+b$ is also an integer.

## (ii) Commutative property

Observe the following and fill in the blanks.

| Statement 1 | Statement 2 | Conclusion |
| :--- | :--- | :--- |
| $4+3=7$ | $3+4=7$ | $4+3=3+4=7$ |
| $3+5=$ | $5+3=$ |  |
| $3+1=$ | $1+3=$ |  |

Do you observe any pair of whole numbers for which the sum is different, when the order of numbers is interchanged? You will not find such a pair. Thus, we say that the addition of whole numbers is commutative.

Is addition of integers commutative? Study the following and fill in the blanks.

| Statement 1 | Statement 2 | Conclusion |
| :--- | :--- | :--- |
| $5+(-6)=-1$ | $(-6)+5=-1$ | $5+(-6)=(-6)+5=-1$ |
| $-9+2=$ | $2+(-9)=$ |  |
| $-4+(-5)=$ | $(-5)+(-4)=$ |  |

Do you observe any pair of integers for which the sum is different when the order is interchanged? You would have not. Therefore, addition is commutative for integers.

## In general, for any two integers $a$ and $b, a+b=b+a$

## (iii) Associative property

Let us observe the following examples.
(i) $(2+3)+4$
$2+(3+4)$
$=5+4$
$=2+7$
$=9$
$=9$
(ii) $(-2+3)+5$
$-2+(3+5)$
$=1+5$
$=-2+8$
$=6$
$=6$
(iii) $(-2+3)+(-5)$
$(-2)+[3+(-5)]$
$=1+(-5)$
$=(-2)+(-2)$
$=-4$
$=-4$
(iv) $[(-2)+(-3)]+(-5) \quad-2+[(-3)+(-5)]$

$$
\begin{array}{ll}
=-5+(-5) & =-2+(-8) \\
=-10 & =-10
\end{array}
$$

Is the sum in each case equal? You will find this to be true.

## Therefore, integers follow the associative property under addition.

## Try This

1. Check whether the following are true or false?

$$
\begin{equation*}
(2+5)+4=2+(5+4) \tag{i}
\end{equation*}
$$

(ii) $\quad(2+0)+4=2+(0+4)$
2. Does the associative property hold for whole numbers? Explain with two more examples.

$$
\text { In general, for any three integers } a, b \text { and } c,(a+b)+c=a+(b+c)
$$

## (iv) Additive identity

Observe the following additions.

$$
\begin{aligned}
-2+0 & =-2 \\
5+0 & =5 \\
8+0 & = \\
-10+0 & =
\end{aligned}
$$

On adding ' 0 ' to integers, do you get the same integer? Yes, we get the same integer.
Therefore, ' 0 ' is the additive identity for integers.

## In general, for any integer $\mathbf{a}, \mathbf{a + 0}=0+\mathbf{a}=\mathbf{a}$

## Try This

1. Compute the following.
(i) $2+0=$
(ii) $0+3=$
(iii) $5+0=$
2. Similarly, add ' 0 ' to as many whole numbers as possible.

Is ' 0 ' the additive identity for whole numbers?
(v) Additive Inverse

What should be added to 3 to get its additive identity ' 0 '?
Observe the following-

$$
\begin{aligned}
& 3+(-3)=0 \\
& 7+(-7)=0 \\
& (-10)+10=0
\end{aligned}
$$

Can we get similar pairs for all integers as above?
In each pair given above, one integer is called the additive inverse of the other integer.
In general, for any integer ' $\mathbf{a}$ ' there exists an integer ( $-\mathbf{a}$ ) such that $\mathbf{a}+(\mathbf{- a})=0$. a and (-a) are additive inverse of each other.

### 1.2.2 Properties of integers under multiplication

## (i) Closure property

Observe the following and complete the table.

| Statement | Conclusion |
| :--- | :--- |
| $9 \times 8=72$ | The product is an integer |
| $10 \times 0=$ |  |
| $-15 \times 2=$ |  |
| $-15 \times 3=-45$ |  |
| $-11 \times(-8)=$ |  |
| $10 \times 10=$ |  |
| $5 \times(-3)=$ |  |

Is it possible to find pairs of integers whose product is not an integer? You will not find this to be possible. Therefore, integers follow the closure property of multiplication.

$$
\text { In general, if } a \text { and } b \text { are two integers, } a \times b \text { is also an integer. }
$$

```
%)
(i) \(2 \times 3=\)
(ii) \(5 \times 4=\)
``` \(\qquad\)
```

(iii) $3 \times 6=$

``` \(\qquad\)
```

(iv) Is the product of any two whole numbers always a whole number?

```
(ii) Commutative property

We know that multiplication is commutative for whole numbers. Is it also commutative for integers?
\begin{tabular}{|l|l|l|}
\hline \multicolumn{1}{|c|}{ Statement 1 } & \multicolumn{1}{c|}{ Statement 2 } & \multicolumn{1}{c|}{ Conclusion } \\
\hline \(5 \times(-2)=-10 ;\) & \((-2) \times 5=-10\) & \(5 \times(-2)=(-2) \times 5=-10\) \\
\hline\((-3) \times 6=\) & \(6 \times(-3)=\) & \\
\hline\(-20 \times 10=\) & \(10 \times(-20)=\) & \\
\hline
\end{tabular}

It is true for all the above cases? Can you give one example such that product of two integers is not an integer? Impossible. Therefore, multiplication of integers follows the commutative property.

\section*{In general, for any two integers \(\mathbf{a}\) and \(\mathbf{b}, \mathbf{a} \times \mathbf{b}=\mathbf{b} \times \mathbf{a}\)}

\section*{(iii) Associative property}

Consider the multiplication of \(2,-3,-4\) grouped as follows.
\([2 \times(-3)] \times(-4) \quad\) and \(\quad 2 \times[(-3) \times(-4)]\)
We see that-
\([2 \times(-3)] \times(-4) \quad\) and \(\quad 2 \times[(-3) \times(-4)]\)
\(=(-6) \times(-4)\)
\(=24\)
\[
=2 \times 12
\]
\[
=24
\]

In first case \(2,-3\) are grouped together and in the second \(-3,-4\) are grouped together. In both cases the product is the same.

Thus, \([2 \times(-3)] \times[(-4)]=2 \times[(-3) \times(-4)]\)
Does the grouping of integers affect the product of integers? No, it does not.
The product of three integers does not depend upon the grouping of integers. Therefore, the multiplication of integers is associative.

In general, for any integers, \(\mathbf{a}, \mathbf{b}\) and \(\mathbf{c},(\mathbf{a} \times \mathbf{b}) \times \mathbf{c}=\mathbf{a} \times(\mathbf{b} \times \mathbf{c})\)

\section*{Do This}
1. Is \([(-5) \times 2)] \times 3=(-5) \times[(2 \times 3)]\) ?
2. Is \([(-2) \times 6] \times 4=(-2) \times[(6 \times 4)]\) ?

\section*{Try This}
1. \((5 \times 2) \times 3=5 \times(2 \times 3)\)
2. Is the associative property true for whole numbers? Take many more examples and verify.
(iv) Distributive property

We know that, \(9 \times(10+2)=(9 \times 10)+(9 \times 2)\)

Thus, multiplication distributes over addition is true for whole numbers.

Let us see, is this true for integers-
(i) \(-2 \times(1+3)=[(-2) \times 1]+[(-2) \times 3]\)
\(-2 \times 4=-2+(-6)\)
\(-8 \quad=-8\)
(ii) \(-1 \times[3+(-5)]=[(-1) \times 3]+[(-1) \times(-5)]\)
\[
-1 \times(-2)=-3+(+5)
\]
\[
2=2
\]
\[
\text { Verify }-3 \times(-4+2)=[(-3) \times(-4)]+[-3 \times(2)]
\]

You will find that in each case, the left hand side is equal to the right hand side.
Thus, multiplication distributes over addition of integers too.

In general, for any integers \(\mathbf{a}, \mathbf{b}\) and \(\mathbf{c}, \mathbf{a} \times(\mathbf{b}+\mathbf{c})=\mathbf{a} \times \mathbf{b}+\mathbf{a} \times \mathbf{c}\)

\section*{(v) Multiplicative identity}

Observe the following multiplications and fill in the blanks.
\[
\begin{array}{ll}
2 \times 1 & =2 \\
-5 \times 1 & =-5 \\
-3 \times 1 & = \\
-8 \times 1 & = \\
1 \times(-5) & =
\end{array}
\]

1 is the multiplicative identity of integers

You will find that multiplying an integer by 1 does not change the integer. Thus, 1 is called the multiplicative identity for integers.

In general, for any integer ' \(a\) ', \(\mathbf{a} \times 1=1 \times \mathbf{a}=\mathbf{a}\)

\section*{(vi) Multiplication by zero}

We know that any whole number when multiplied by zero gives zero. What happens in case of integers? Observe the following.
\[
\begin{array}{ll}
(-3) \times 0 & =0 \\
0 \times(-8) & =- \\
9 \times 0 & =
\end{array}
\]

\section*{This shows that the product of an integer and zero is zero.}
\[
\text { In general for any integer } a, \quad \mathbf{a} \times 0=0 \times \mathbf{a}=0
\]

Exercise - 1.5
1. Verify the following.
(i) \(18 \times[7+(-3)]=[18 \times 7]+[18 \times(-3)]\)
(ii) \((-21) \times[(-4)+(-6)]=[(-21) \times(-4)]+[(-21) \times(-6)]\)
2. (i) For any integer a, what is \((-1) \times\) a equal to?
(ii) Determine the integer whose product with \((-1)\) is 5
3. Compute the following products using suitable properties.
(i) \(26 \times(-48)+(-48) \times(-36)\)
(ii) \(8 \times 53 \times(-125)\)
(iii) \(15 \times(-25) \times(-4) \times(-10)\)
(iv) \((-41) \times 102\)
(v) \(625 \times(-35)+(-625) \times 65\)
(vi) \(7 \times(50-2)\)
(vii) \((-17) \times(-29)\)
(viii) \((-57) \times(-19)+57\)

\subsection*{1.2.3 Properties of integers under subtraction}

\section*{(i) Closure under subtraction}

Do we always get an integer, when subtracting an integer from an integer?
Do the following.

What did you find? Can we say that integers follow the closure property for subtraction?

\section*{In general for any integers \(a\) and \(b, a-b\) is also an integer.}

\section*{(ii) Commutativity under subtraction}

Let us take an example.
Consider the integers 6 and -4
\[
\begin{aligned}
& 6-(-4)=6+4=10 \text { and } \\
& -4-(6)=-4-6=-10
\end{aligned}
\]

Therefore, \(\quad 6-(-4) \neq-4-(6)\)

\section*{Thus, subtraction is not commutative for integers.}

\section*{Try This}

Take atleast 5 different pairs of integers and verify commutative property on them.

\subsection*{1.2.4 Properties of integers under division}
(i) Closure Property

Observe the following table and complete it.
\begin{tabular}{|l|l|l|l|}
\hline Statement & Inference & Statement & Inference \\
\hline\((-8) \div(-4)=2\) & Result is an integer & \((-8) \div 4=\frac{-8}{4}=-2\) & \\
\hline\((-4) \div(-8)=\frac{-4}{-8}=\frac{1}{2}\) & Result is not an integer & \(4 \div(-8)=\frac{4}{-8}=\frac{-1}{2}\) & \\
\hline
\end{tabular}

What do you observe from table? You will observe that integers are not closed under division.

\section*{Try This}

Take atleast five pairs of integers and check whether they are closed under division.

\section*{(ii) Commutative Property}

We know that division is not commutative for whole numbers. Let us check it for integers also.
You can see from the table given above that \((-8) \div(-4) \neq(-4) \div(-8)\).
Is \((-9) \div 3\) equal to \(3 \div(-9)\) ?
Is \((-30) \div(6)\) equal to \((-6) \div(-30)\) ?
Thus, we can say that division of integers is not commutative.

\section*{Try This}

Take atleast 5 pairs of integers and observe whether the division of integers is commutative or not?

\section*{(iii) Division by Zero}

We can divide anything into 2 parts, 3 parts, ..... but not zero parts. Therefore, any integer divided by zero is meaningless and zero divided by a non-zero integer is equal to zero.
\[
\text { For any integer } a, a \div 0 \text { is not defined but } 0 \div a=0 \text { for } a \neq 0 \text {. }
\]

\section*{(iv) Division by 1}

Observe the following-
\((-8) \div 1=(-8)\)
(11) \(\div 1=+11\)
\((-13) \div 1=\) \(\qquad\) \((-25) \div 1=\) \(\qquad\)

Thus, from the above examples a negative integer or a positive integer divided by 1 gives the same integer as quotient.

In general, for any integer \(a, a \div 1=a\).
What happens when we divide any integer by \((-1)\) ? Complete the following table-
\((-8) \div(-1)=8\)
\(11 \div(-1)=-11\)
\(13 \div(-1)=\) \(\qquad\)
\[
(-25) \div(-1)=
\]

We can say that if any integer is divided by ( -1 ) it does not give the same integer, but gives its additive identity.

\section*{Try This}
1. For any integer a , is
(i) \(\mathrm{a} \div 1=1\) ?
(ii) \(\mathrm{a} \div(-1)=-\mathrm{a}\) ?

Take different values of 'a' and check.
(v) Associative property

Consider the integers \(-16,4,-2\)
Is \([(-16) \div 4] \div(-2)=(-16) \div[4 \div(-2)]\) ?
\([(-16) \div 4] \div(-2)=(-4) \div(-2)=2\)
\((-16) \div[4 \div(-2)]=(-16) \div(-2)=8\)
Therefore, \([(-16) \div 4] \div(-2) \neq(-16) \div[4 \div(-2)]\)
Thus, division of integers is not associative.

\section*{Try This}

Take atleast five more examples and check whether division is associative for integers.

\section*{Exercise - 1.6}
1. Fill the following blanks.
(i) \(-25 \div \ldots \ldots . .=25\)
(ii) \(\ldots \ldots . . \div 1=-49\)
(iii) \(50 \div 0=\ldots . . . . . . . . . . . . . .\).
(iv) \(0 \div 1=\)

\subsection*{1.3 Some problems using negative numbers}

Example 1: In a test \((+5)\) marks are given for every correct answer and ( -2 ) marks are given for every incorrect answer. (i) Radhika answered all the questions and scored 30 marks through 10 correct answers. (ii) Jaya also answered all the questions and scored (-12) marks through 4 correct answers. How many incorrect answers had both Radhika and Jaya attempted?
Solution :
(i) Marks given for one correct answer \(=5\)

So marks given for 10 correct answers \(=5 \times 10=50\)
Radhika's score \(=30\)
Marks obtained for incorrect answers \(=30-50=-20\)
Marks given for one incorrect answer \(=(-2)\)
Therefore, Radhika had number of incorrect answers \(=(-20) \div(-2)=10\)
(ii) Marks given for 4 correct answers

Jaya's score
Marks obtained for incorrect answers \(=-12-20=-32\)
Marks given for one incorrect answer \(=(-2)\)
Therefore, Jaya had number of incorrect answers \(=(-32) \div(-2)=16\)
Example 2: A shopkeeper earns a profit of ` 1 by selling one pen and incurs a loss of 40 paise per pencil while selling pencils of his old stock.
(i) In a particular month he incurs a loss of ` 5 . In this period, he sold 45 pens. How many pencils did he sell in this period?
(ii) In the next month he earns neither profit nor loss. If he sold 70 pens, how many pencils did he sell?

Solution : (i) Profit earned by selling one pen ` 1
Profit earned by selling 45 pens \(=` 1 \times 45=` 45\), which we denote by 45
Total loss given \(=` 5\) i.e. -5 .
Profit earned on pens + Loss incurred on pencils \(=\) Total loss (In this question)
Therefore, Loss incurred on pencils \(=\) Total loss - Profit earned on pens
\[
=-5-(45)=(-50)=-` 50=-5000 \text { paise }
\]

Loss incurred by selling one pencil \(=40\) paise which we write as -40 paise
So, number of pencils sold \(\quad=(-5000) \div(-40)=125\) pencils.
(ii) In the next month there is neither profit nor loss.

So, Profit earned on pens + Loss incurred on pencils \(=0\)
i.e., Profit earned on pens \(=-\) Loss incurred on pencils.

Now, profit earned by selling 70 pens \(=` 70\)
Hence, loss incurred by selling pencils \(=-` 70\) or -7000 paise.
Total number of pencils sold \(\quad=(-7000) \div(-40)=175\) pencils.

\section*{Exercise - 1.7}
1. In a class test containing 15 questions, 4 marks are given for every correct answer and (-2) marks are given for every incorrect answer. (i) Bharathi attempts all questions but only 9 answers are correct. What is her total score? (ii) One of her friends Hema attempts only 5 questions and all are correct. How many marks did they score?
2. A cement company earns a profit of ` 9 per bag of white cement sold and a loss of - 5 per bag of grey cement sold.
(i) The company sells 7000 bags of white cement and 6000 bags of grey cement in a month. What is its profit or loss?
(ii) What is the number of white cement bags it must sell to have neither profit nor loss, if the number of grey bags sold is 5400 .
3. The temperature at 12 noon was \(10^{\circ} \mathrm{C}\). If it decreases at the rate of \(2^{\circ} \mathrm{C}\) per hour (i) at what time would the temperature be \(8^{\circ} \mathrm{C}\) below \(0^{\circ} \mathrm{C}\) ? (ii) what would be the temperature at 12 midnight?
4. In a class test ( +3 ) marks are given for every correct answer and ( -2 marks are given for every incorrect answer and no marks for not attempting any question. (i) Radhika scored 20 marks. If she has got 12 correct answers, how many questions has she attempted incorrectly? (ii) Mohini scores ( -5 ) marks in this test, though she has got 7 correct answers. How many questions has she attempted incorrectly?
5. An elevator descends into a mine shaft at the rate of 6 meters per minute. If the descent starts from 10 m above the ground level, how long will it take to reach -350 m .

\section*{Looking Back}
1. \(\mathbf{N}\) (natural numbers) \(=\{1,2,3,4,5 \ldots\}\)
\(\mathrm{W}(\) whole numbers \()=\{0,1,2,3,4,5 \ldots\}\)

\(\mathbf{Z}(\) Integers \()=\{\ldots . .-4,-3,-2,-1,0,1,2,3,4 \ldots\}\)
also we can write \(\mathrm{Z}=\{0, \pm 1, \pm 2, \pm 3 \ldots .\).\(\} . Set of integers also represented as I.\)
2. (i) Each time you add a positive integer, you move right on the number line.
(ii) Each time you add a negative integer, you move left on the number line.
3. (i) Each time you subtract a positivie integer, you move left on the number line.
(ii) Each time you subtract a negative integer, you move right on the number line.
4. (i) Each time you multiply a negative integer by a positive integer or a positive integer by a negative integer, the product is a negative integer.
(ii) Each time you multiply two negative integers, the product is a positive integer.
(iii) Product of even number of negative integers is positive (+ve), product of odd number of negative integers is negative (-ve).
5. (i) Each time you divide a negative integer by a positive integer or a positive integer by a negative integer the quotient is negative integer.
(ii) Each time you divide negative integer by a negative integer the quotient is positive integer.
(iii) When you multiply or divide two integers of same sign the result is always positive; if they are of opposite signs the result is negative.
6. Properties of Integers
\begin{tabular}{|l|c|c|c|c|}
\hline Property & Addition \((+)\) & Subtraction \((-)\) & Multiplication \((\times)\) & Division \((\div)\) \\
\hline Closure & 3 & 3 & 3 & \(\times\) \\
\hline Commutative & 3 & \(\times\) & 3 & \(\times\) \\
\hline Associative & 3 & \(\times\) & 3 & \(\times\) \\
\hline Identity & 3 & - & 3 & - \\
\hline Inverse & 3 & - & \(\times\) & - \\
\hline
\end{tabular}
7. In integers multiplication distributes over addition. i.e., \(a \times(b+c)=a \times b+a \times c\) for any three integers \(\mathrm{a}, \mathrm{b}\) and c .
8. (i) For any integer \(\mathrm{a}, \mathrm{a} \div 0\) is not defined or meaningless
(ii) For any non zero integer \(\mathrm{a}, 0 \div \mathrm{a}=0\) (for \(\mathrm{a} \neq 0\) )
(iii) \(\mathrm{a} \div 1=\mathrm{a}\)

\subsection*{2.0 Introduction}

We come across many examples in our day-to-day life where we use fractions. Just try to recall them. We have learnt how to represent proper and improper fractions and their addition and subtraction in the previous class. Let us review what we have already learnt and then go further to multiplication and division of fractional numbers as well as of decimal fractions. We will conclude by an introduction to a bigger set of numbers called rational numbers.

The shaded portion of the figures given below have been represented using fractions. Which of these are correct?

Figure 1
\(\frac{1}{2}\)
Y/N
Reason \(\qquad\)

Figure 2
\(\frac{1}{2}\)
Y/N
Reason

Figure 3
\(\frac{1}{3}\)
Y/N
Reason

While observing the above figures, you have already identified the figures which have equal parts.
Make 5 more such examples and give them to your friends to verify.
Observe, Neha's representation of \(\frac{1}{2}\) in different figures in the following.

Do you think that the shaded portions correctly represent \(\frac{1}{2}\) ? Then what fractions are represented by unshaded portions?

\section*{Try This}

Represent \(\frac{3}{4}, \frac{1}{4}\) in different ways by drawing different figures. Justify your representation by checking with your friends.

\section*{Proper and Improper fractions}

You have learnt about proper and improper fractions. A proper fraction is a fraction that represents a part of a whole. Give five examples of proper fractions.

Is \(\frac{3}{2}\) a proper fraction? How do you check it as a proper fraction or not?
What are the properties of improper fractions? One of them is that in improper fractions the numerator is more than or equal to the denominator. What else do we know about these fractions. We can see that all improper fractions can be written as mixed fractions. For example, the improper fraction \(\frac{3}{2}\) can be written as \(1 \frac{1}{2}\). This is a mixed fraction. This contains an integral part and a fractional part. The fractional part should be a proper fraction.

\section*{Do This}
1. Write any five examples, each of proper, improper and mixed fractions?

\section*{Try This}

Represent \(2 \frac{1}{4}\) pictorially. How many units are needed for this?

\section*{Comparison of fractions}

Do you remember how to compare like fractions? For example in fractions \(\frac{1}{5}\) and \(\frac{3}{5}, \frac{3}{5}\) is bigger than \(\frac{1}{5}\). Why? Can you recall how to compare two unlike fractions, for e.g. \(\frac{5}{7}\) and \(\frac{3}{4}\) ?

We convert these into like fractions and then compare them.
\[
\begin{aligned}
& \frac{5}{7} \times \frac{4}{4}=\frac{20}{28} \text { and } \frac{3}{4} \times \frac{7}{7}=\frac{21}{28} \\
& \frac{20}{28}<\frac{21}{28}
\end{aligned}
\]
\(\frac{5}{7}=\frac{20}{28}\) and \(\frac{3}{4}=\frac{21}{28}\)
Thus, \(\frac{5}{7}<\frac{3}{4}\)
1. Write five equivalent fractions for (i) \(\frac{3}{5} \quad\) (ii) \(\frac{4}{7}\).
2. Which is bigger \(\frac{5}{8}\) or \(\frac{3}{5}\) ?
3. Determine which of the following pairs are equal by writing each in their simplest form.
(i) \(\frac{3}{8}, \frac{375}{1000}\)
(ii) \(\frac{18}{54}, \frac{23}{69}\)
(iii) \(\frac{6}{10}, \frac{600}{1000}\)
(iv) \(\frac{17}{27}, \frac{25}{45}\)

\section*{You have already learnt about addition and subtraction of fractions in class VI. Let us solve some problems now.}

Example 1: Razia completes \(\frac{3}{7}\) part of her homework, while Rekha completed \(\frac{4}{9}\) of it. Who has completed the least part of homework?
Solution: \(\quad\) To find this we have to compare \(\frac{3}{7}\) and \(\frac{4}{9}\).
Converting them to like fractions we have
\[
\frac{3}{7}=\frac{27}{63}, \quad \frac{4}{9}=\frac{28}{63}
\]
where, \(\frac{27}{63}<\frac{28}{63}\) and so \(\frac{3}{7}<\frac{4}{9}\)
From this, we say that Razia has completed a least part of her homework.
Example 2: Shankar's family consumed \(3 \frac{1}{2} \mathrm{~kg}\) sugar in the first 15 days of a month. For the next 15 days they consumed \(3 \frac{3}{4} \mathrm{~kg}\) sugar. How much sugar did they consume for

Solution : The total weight of the sugar for the whole month
\[
\begin{aligned}
& =\left(3 \frac{1}{2}+3 \frac{3}{4}\right) \mathrm{kg} \\
& =\left(\frac{7}{2}+\frac{15}{4}\right) \mathrm{kg}=\left(\frac{7 \times 2}{2 \times 2}+\frac{15}{4}\right) \mathrm{kg}=\left(\frac{14}{4}+\frac{15}{4}\right) \mathrm{kg} \\
& =\frac{29}{4} \mathrm{~kg}=7 \frac{1}{4} \mathrm{~kg} .
\end{aligned}
\]

Example 3: At Ahmed's birthday party, \(\frac{5}{7}\) part of the total cake was distributed. Find how much cake is left?

Solution: \(\quad\) Total cake \(=1\) or \(\frac{1}{1}\)
Part of cake distributed \(=\frac{5}{7}\)
Part of cake left \(\quad=\frac{1}{1}-\frac{5}{7}\)
\[
\begin{aligned}
& =\frac{1 \times 7}{1 \times 7}-\frac{5}{7} \\
& =\frac{7}{7}-\frac{5}{7}=\frac{2}{7}
\end{aligned}
\]

Thus, \(\frac{2}{7}\) part of the total cake is left now.
1. Compute and express the following results as a mixed fraction?
(i) \(2+\frac{3}{4}\)
(ii) \(\frac{7}{9}+\frac{1}{3}\)
(iii) \(1-\frac{4}{7}\)
(iv) \(2 \frac{2}{3}+\frac{1}{2}\)
(v) \(\frac{5}{8}-\frac{1}{6}\)
(vi) \(2 \frac{2}{3}+3 \frac{1}{2}\)
2. Arrange the following in ascending order.
(i) \(\frac{5}{8}, \frac{5}{6}, \frac{1}{2}\)
(ii) \(\frac{2}{5}, \frac{1}{3}, \frac{3}{10}\)
3. Check in the following square, whether in this square the sum of the numbers in each row and in each column and along the diagonals is the same.
\begin{tabular}{|c|c|c|}
\hline\(\frac{6}{13}\) & \(\frac{13}{13}\) & \(\frac{2}{13}\) \\
\hline\(\frac{3}{13}\) & \(\frac{7}{13}\) & \(\frac{11}{13}\) \\
\hline\(\frac{12}{13}\) & \(\frac{1}{13}\) & \(\frac{8}{13}\) \\
\hline
\end{tabular}
4. A rectangular sheet of paper is \(5 \frac{2}{3} \mathrm{~cm}\) long and \(3 \frac{1}{5} \mathrm{~cm}\) wide. Find its perimeter.
5. The recipe requires \(3 \frac{1}{4}\) cups of flour. Radha has \(1 \frac{3}{8}\) cups of flour. How many more cups of flour does she need?
6. Abdul is preparing for his final exam. He has completed \(\frac{5}{12}\) part of his course content. Find out how much course content is left?
7. Find the perimeters of (i) \(\triangle \mathrm{ABE}\) (ii) the rectangle BCDE in this figure. Which figure has greater perimeter and how much?

\subsection*{2.1 Multiplication of fractions}
2.1.1 Multiplication of a fraction by a whole number

In multiplication of whole numbers, while finding as product we
 repeatedly adding a number. For example \(5 \times 4\) means adding 5 groups of 4 each or 5 times 4 .
Thus, when we say \(2 \times \frac{1}{4}\) it means adding \(\frac{1}{4}\) twice or 2 times \(\frac{1}{4}\).
Let us represent this pictorially. Look at Figure 1. Each shaded part is \(\frac{1}{4}\) part of a square. The two shaded parts together will represent \(2 \times \frac{1}{4}=\frac{1}{4}+\frac{1}{4}=\frac{2}{4}\) (Figure 2).

Figure 1

Figure 2

Let us now find \(3 \times \frac{1}{2}\). This means three times \(\frac{1}{2}\) or three halves.
Thus \(3 \times \frac{1}{2}=\frac{1}{2}+\frac{1}{2}+\frac{1}{2}=\frac{3}{2}\)

\section*{Do This}
1. Find (i) \(4 \times \frac{2}{7}\)
(ii) \(4 \times \frac{3}{5}\)
(iii) \(7 \times \frac{1}{3}\)

The fractions that we have considered till now, i.e., \(\frac{1}{2}, \frac{1}{3}, \frac{2}{7}\) and \(\frac{3}{5}\) are proper fractions.

Let us see how to multiply improper fractions by a whole number. For example, \(2 \times \frac{5}{3}\)
\[
2 \times \frac{5}{3}=\frac{5}{3}+\frac{5}{3}=\frac{10}{3}=3 \frac{1}{3}
\]

Represent pictorially

\[
\frac{5}{3}+\frac{5}{3} \quad=\frac{10}{3}=3 \frac{1}{3}
\]

\section*{Try This}
1. Find
(i) \(5 \times \frac{3}{2}\)
(ii) \(4 \times \frac{7}{5}\)
(iii) \(7 \times \frac{8}{3}\)

We know the area of a rectangle is equal to length \(\times\) breadth. If the length and breadth of a rectangle are 6 cm and 5 cm respectively, then what will be its area? Obviously the area would be \(6 \times 5=30 \mathrm{~cm}^{2}\).
If the length and breadth of other rectangle are \(6 \mathrm{~cm}, 2 \frac{1}{3} \mathrm{~cm}\) respectively,
 what would be the area of that rectangle?

Area of a rectangle is the product of its length and breadth. To multiply a mixed fraction with a whole number, first convert the mixed fractions into an improper fraction and then multiply.

Therefore, area of a rectangle \(=6 \times 2 \frac{1}{3}\)
\[
=6 \times \frac{7}{3}=\frac{42}{3} \mathrm{~cm}^{2}=14 \mathrm{~cm}^{2}
\]

You might have realised by now that to multiply a whole number with a proper or an improper fraction, we multiply the whole number with the numerator of the fraction, keeping the denominator the same.

\section*{Do These}
1. Find the following.
(i) \(3 \times 2 \frac{2}{7}\)
(ii) \(5 \times 2 \frac{1}{3}\)
(iii) \(8 \times 4 \frac{1}{7}\)
(iv) \(4 \times 1 \frac{2}{9}\)
(v) \(5 \times 1 \frac{1}{3}\)
2. Represent pictorially \(2 \times \frac{1}{5}=\frac{2}{5}\)

Consider \(\frac{1}{2} \times 5\). How do you understand it?
\(\frac{1}{2} \times 5\) means half of 5 , which is \(\frac{5}{2}\) or \(2 \frac{1}{2}\)

Thus, \(\frac{1}{2}\) of \(5=\frac{1}{2} \times 5=\frac{5}{2}\)

Similarly \(=\frac{1}{2}\) of \(3=\frac{1}{2} \times 3=\frac{3}{2}\) or \(1 \frac{1}{2}\)

\section*{Here onwards 'of' represents multiplication.}

So what would \(\frac{1}{4}\) of 16 mean? It tells us that the whole (16) is to be divided into 4 equal parts and one part out of that has to be taken. When we make 4 equal parts of 16 , each part will be 4 . So \(\frac{1}{4}\) of 16 is 4 .

This can be illustrated with marbles as shown in the below figure:

\(\frac{1}{4}\) of \(16=\frac{1}{4} \times 16=\frac{16}{4}=4\)
Similarly, \(\frac{1}{2}\) of \(16=\frac{1}{2} \times 16=\frac{16}{2}=8\).
Example 4: Nazia has 20 marbles. Reshma has \(\frac{1}{5}\) of the number of marbles that Nazia has. How many marbles does Reshma have?

Solution: Reshma has \(\frac{1}{5} \times 20=4\) marbles.
Example 5: In a family of four persons 15 chapaties were consumed in a day. \(\frac{1}{5}\) of the chapaties were consumed by the mother and \(\frac{3}{5}\) were consumed by the children and the remaining were eaten by the father.
(i) How many chapaties were eaten by the mother?
(ii) How many chapaties were eaten by the children?
(iii) What fraction of the total chapaties has been eaten by the father?

Solution : Total number of chapaties \(=15\)
(i) Number of chapaties eaten by mother \(=\frac{1}{5}\) of total \(=\frac{1}{5} \times 15=3\) chapaties
(ii) Number of chapaties eaten by children \(=\frac{3}{5}\) of total \(=\frac{3}{5} \times 15=9\) chapaties
(iii) Chapaties left \(=15-3-9=3\) chapaties

Fraction of chapathies eaten by father \(=\frac{3}{15}=\frac{1}{5}\)
1. Multiply the following. Write the product as a mixed fraction.
(i) \(\frac{3}{6} \times 10\)
(ii) \(\frac{1}{3} \times 4\)
(iii) \(\frac{6}{7} \times 2\)
(iv) \(\frac{2}{9} \times 5\)
(v) \(15 \times \frac{2}{5}\)
2. Shade the given portion in the following figures.
(i) \(\frac{1}{2}\) of the circles in box (a)
(ii) \(\frac{2}{3}\) of the triangles in box (b)
(iii) \(\frac{3}{5}\) of the rectangles in box (c)

(a)

(b)
(iv) \(\frac{3}{4}\) of the circles in box (d)

(c)
3. Find (i) \(\frac{1}{3}\) of \(12 \quad\) (ii) \(\frac{2}{5}\) of 15

\subsection*{2.1.2 Multiplication of a fraction with a fraction}

What does \(\frac{1}{2} \times \frac{1}{4}\) mean? From the above we can understand that it means \(\frac{1}{2}\) of \(\frac{1}{4}\).

Consider \(\frac{1}{4}\) -

How will we find \(\frac{1}{2}\) of this shaded part? We can divide this one-fourth \(\left(\frac{1}{4}\right)\) shaded part into two
equal parts (Figure 1). Each of these two parts represents \(\frac{1}{2}\) of \(\frac{1}{4}\).

Let us call one of these parts as part ' \(A\) '. What fraction of whole circle is ' \(A\) '? If we divide the remaining parts of the circle into two equal parts each, we get a total of eight equal parts. 'A' is one of these parts. So, ' \(A\) ' is \(\frac{1}{8}\) of the whole.

Figure 2

Let us find \(\frac{1}{3} \times \frac{1}{2}\) and \(\frac{1}{2} \times \frac{1}{3}\).

From this, we can see that \(\frac{1}{3} \times \frac{1}{2}=\frac{1}{2} \times \frac{1}{3}\)

\section*{Do These}
1. Fill in these boxes:
(i) \(\frac{1}{5} \times \frac{1}{7}=\frac{1 \times 1}{5 \times 7}=\)(ii)
\(\frac{1}{2} \times \frac{1}{6}=\square=\square\)
2. Find \(\frac{1}{2} \times \frac{1}{5}\) and \(\frac{1}{5} \times \frac{1}{2}\) using diagram, check whether \(\frac{1}{2} \times \frac{1}{5}=\frac{1}{5} \times \frac{1}{2}\)
3. Find \(\frac{9}{3} \times \frac{5}{5}\). Draw and check answer.

Consider one more example \(\frac{2}{3}\) of \(\frac{2}{5}\). We have shown \(\frac{2}{5}\) in Figure 1 and \(\frac{2}{3} \times \frac{2}{5}\) in Figure 2 .

The cross hatched portion in figure (2) represents \(\frac{2}{3}\) of \(\frac{2}{5}\) i.e. \(\frac{2}{3} \times \frac{2}{5}=\frac{4}{15}\)

To find the \(\frac{2}{3}\) of \(\frac{2}{5}\), we have made three equal parts of \(\frac{2}{5}\) and then selected 2 out of the 3 parts. This represent 4 parts out of a total 15 parts so \(\frac{2}{3}\) of \(\frac{2}{5}=\frac{2}{3} \times \frac{2}{5}=\frac{4}{15}\).

\section*{From this, we can say that Product of two fractions \(=\frac{\text { Product of Numerators }}{\text { Product of Denominators }}\).}

Now, we will find the area of the rectangle if its length and breadth are \(6 \frac{1}{2} \mathrm{~cm}\) and \(3 \frac{1}{2} \mathrm{~cm}\) respectively.

Example 6: Narendra reads \(\frac{1}{4}\) of a short novel in 1 hour. What part
of the book will he have read in \(2 \frac{1}{2}\) hours?
Solution : \(\quad\) The part of the novel read by Narendra in 1 hour \(=\frac{1}{4}\)
So the part of the novel read by him in \(2 \frac{1}{2}\) hours \(=2 \frac{1}{2} \times \frac{1}{4} \quad=\frac{5}{2} \times \frac{1}{4}=\frac{5}{8}\)
So Narendra would read \(\frac{5}{8}\) part of the novel in \(2 \frac{1}{2}\) hours.
Example 7: A swimming pool is filled \(\frac{3}{10}\) part in half an hour. How much will it be filled in \(1 \frac{1}{2}\)
hour?
Solution : The part of the pool filled in half an hour \(=\frac{3}{10}\).
So, the part of pool which is filled in \(1 \frac{1}{2}\) hour is 3 times the pool filled in half an hour.
\[
=3 \times \frac{3}{10}=\frac{9}{10}
\]

Thus, \(\frac{9}{10}\) part of the pool will be filled in \(1 \frac{1}{2}\) hours.

\section*{Try This}

You have seen that the product of two natural numbers more than 1, bigger than each of the two natural numbers. For example, \(3 \times 4=12,12>4\) and \(12>3\). What happens to the value of the product when we multiply two proper fractions?

Fill the following table and conclude your observations.
Eg: \(\frac{2}{3} \times \frac{4}{5}=\frac{8}{15} \quad \frac{8}{15}<\frac{2}{3}, \frac{8}{15}<\frac{4}{5} \quad \begin{aligned} & \text { Product is less than each } \\ & \text { of the fractions }\end{aligned}\)
\(\frac{1}{5} \times \frac{2}{7}=-----\)
\(\frac{3}{5} \times \frac{\square}{8}=\frac{21}{40}\)
\(\frac{2}{\square} \times \frac{4}{9}=\frac{8}{45}\)

\section*{Exercise - 2.3}
1. Find each of the following products.
(i) \(\frac{5}{6} \times \frac{7}{11}\)
(ii) \(6 \times \frac{1}{5}\)
(iii) \(2 \frac{1}{3} \times 3 \frac{1}{5}\)
2. Multiply and reduce to its lowest form.
(i) \(\frac{2}{3} \times 5 \frac{1}{5}\)
(ii) \(\frac{2}{7} \times \frac{1}{3}\)
(iii) \(\frac{9}{3} \times \frac{5}{5}\)
(iv) \(\frac{9}{5} \times \frac{10}{3} \times \frac{1}{2}\)
3. Which one is greater?
(i) \(\frac{2}{5}\) of \(\frac{4}{7}\) or \(\frac{3}{4}\) of \(\frac{1}{2}\)
(ii) \(\frac{1}{2}\) of \(\frac{4}{7}\) or \(\frac{2}{3}\) of \(\frac{3}{7}\)
4. Rehana works \(2 \frac{1}{2}\) hours each day on her embroidery. She completes the work in 7 days. How many hours did she take to complete her work?
5. A truck runs 8 km using 1 litre of petrol. How much distance will it cover using \(10 \frac{2}{3}\) litres
6. Raja walks \(1 \frac{1}{2}\) meters in 1 second. How much distance will he walk in 15 minutes?
7. Provide the number in the box \(\square\) to make the statement true.
(i) \(\frac{2}{3} \times \square=\frac{20}{21}\).
(ii)
\(\frac{5}{7} \times \frac{\square}{5}=\frac{3}{\square}\)

\subsection*{2.2 Division of fractions}
1. Imagine you have 15 meters length of cloth and you want to make pieces of \(1 \frac{1}{2}\) metres length each fromit. How many \(1 \frac{1}{2}\) meter pieces will you get? Here we will successively subtract \(1 \frac{1}{2}\) meters from 15 meters and see how many times we can do this, till we have no cloth left.
2. Look at one more example. A paper strip of length \(\frac{21}{2} \mathrm{~cm}\) has to be cut into smaller strips of length \(\frac{3}{2}\) cm each. How many pieces would we get? Clearly, we can cut \(\frac{3}{2} \mathrm{~cm}\) each time or divide \(\frac{21}{2}\) by \(\frac{3}{2}\) i.e., \(\frac{21}{2} \div \frac{3}{2}\).
3. Let us recall division with whole numbers. In \(15 \div 3\), we find out how many 3 's are there in 15 . The answer to this is 5 . Similarly, to find the number of 2 's in 18 , we divide 18 by 2 or \(18 \div 2\). The answer to this is 9 .

Now correlate the same process in dividing whole numbers by fractions and fractions by fractions.

\subsection*{2.2.1 Division of whole number by a fraction}

Let us find \(3 \div \frac{1}{2}\).
Kiran says we have to find how many halves \(\left(\frac{1}{2}\right)\) are there in 3 . We draw the following.

The figure above suggests that there are 6 halves in 3 .

We can therefore say \(3 \div \frac{1}{2}=6\)
Think about \(2 \div \frac{1}{3}\)

This means finding how many one-thirds \(\left(\frac{1}{3}\right)\) are there in two wholes. Can we find in other way? If we observe adjancent figures, there are 6 one-thirds in two wholes i.e. \(2 \div \frac{1}{3}=6\).

\section*{Do This}

Find
(i) \(2 \div \frac{1}{4}\)
(ii) \(7 \div \frac{1}{2}\)
(iii) \(3 \div \frac{1}{5}\)

\subsection*{2.2.1(a) Reciprocal of a fraction (Multiplicative Inverse)}

Now consider \(3 \div \frac{1}{4}\). This means the number of \(\frac{1}{4}\) parts obtained, when each of the three wholes, are divided into \(\frac{1}{4}\) equal parts

The number of one-fourths in 3 is 12 or \(3 \div \frac{1}{4}=12\)

We also see that, \(3 \div \frac{1}{4}=3 \times \frac{4}{1}=12\).
Thus, we have \(3 \div \frac{1}{4}=3 \times \frac{4}{1}\)

Also examine \(2 \div \frac{1}{3}\).
\(2 \div \frac{1}{3}=6\) as \(2 \div \frac{1}{3}=2 \times \frac{3}{1}=6\)

Similarly, \(4 \div \frac{1}{4}=16\) since \(4 \times \frac{4}{1}=16\).

The number \(\frac{3}{1}\) can be obtained by interchanging the numerator and denominator of \(\frac{1}{3}\) or by inverting \(\frac{1}{3}\). Similarly, \(\frac{4}{1}\) is obtained by inverting \(\frac{1}{4}\).

Observe these products and fill in the blanks:
\[
\begin{array}{ll}
7 \times \frac{1}{7}=1 & \frac{2}{3} \times \frac{3}{2}=\frac{2 \times 3}{3 \times 2}=\frac{6}{6}=1 \\
\frac{1}{9} \times 9=\ldots \ldots \ldots \ldots . & \frac{2}{7} \times \ldots \ldots \ldots \ldots=1 \\
\frac{5}{4} \times \frac{4}{5}=\ldots \ldots \ldots \ldots . & \ldots \ldots \ldots \times \frac{5}{9}=1
\end{array}
\]

Multiply five more such pairs.
Any two non-zero numbers whose product is 1 , are called reciprocals of one another. So the reciprocal of \(\frac{4}{7}\) is \(\frac{7}{4}\) and the reciprocal of \(\frac{7}{4}\) is \(\frac{4}{7}\).

Write reciprocals of \(\frac{5}{9}, \frac{2}{5}\).

\section*{Try This}
1. Will the reciprocal of a proper fraction be a proper fraction?
2. Will the reciprocal of an improper fraction be an improper fraction?

Therefore,
\(1 \div \frac{1}{2}=1 \times\) reciprocal of \(\frac{1}{2}=1 \times \frac{2}{1}\).
\(3 \div \frac{1}{4}=3 \times\) reciprocal of \(\frac{1}{4}=3 \times \frac{4}{1}\).
Raju applied this inverting procedure to mixed fractions and said that the reciprocal of \(1 \frac{1}{2}\) is \(1 \frac{2}{1}\). Is he right? Verify.
\(3 \div \frac{1}{2}=\) \(\qquad\) \(=\) \(\qquad\)

So, \(2 \div \frac{3}{4}=2 \times\) reciprocal of \(\frac{3}{4}=2 \times \frac{4}{3}\).
\(5 \div \frac{2}{4}=5 \times\) \(\qquad\) \(=5 \times\) \(\qquad\)

Thus dividing a whole number by a fraction is equivalent to multiplying the whole number by the reciprocal of that fraction.

\section*{Do This}
Find (i) \(9 \div \frac{2}{5}\)
(ii) \(3 \div \frac{4}{7}\)
(iii) \(2 \div \frac{8}{9}\)

For dividing a whole number by a mixed fraction, first convert the mixed fraction into an improper fraction and then solve it.

Example: \(4 \div 3 \frac{2}{5}=4 \div \frac{17}{5}=4 \times \frac{5}{17}=\frac{20}{17} \quad\) Find, \(11 \div 3 \frac{1}{3}=11 \div \frac{10}{3}=\) ?

\section*{Do This}

Find the following.
(i) \(7 \div 5 \frac{1}{3}\)
(ii) \(5 \div 2 \frac{4}{7}\)

\subsection*{2.2.2 Division of a fraction by a whole number}

What does \(\frac{3}{4} \div 3\) equal to?
Based on our earlier observations we have : \(\frac{3}{4} \div 3=\frac{3}{4} \div \frac{3}{1}=\frac{3}{4} \times \frac{1}{3}=\frac{3}{12}=\frac{1}{4}\)
So, \(\frac{2}{3} \div 5=\frac{2}{3} \times \frac{1}{5}=\) ?
What is \(\frac{5}{7} \div 6\) and \(\frac{2}{7} \div 8\) ?

\section*{For dividing mixed fractions by whole numbers, we convert the mixed fractions into improper fractions.}

For example \(2 \frac{1}{3} \div 5=\frac{7}{3} \div 5=\frac{7}{3} \times \frac{1}{5}=\frac{7}{15}\). Similarly, \(4 \frac{2}{5} \div 3=\ldots \ldots=\ldots .\). and \(2 \frac{3}{5} \div 2=\ldots . .=\ldots\). .

\subsection*{2.2.3 Division of a fraction by another fraction}

Let us find \(\frac{1}{4} \div \frac{5}{6}\).
\(\frac{1}{4} \div \frac{5}{6}=\frac{1}{4} \times\) reciprocal of \(\frac{5}{6}=\frac{1}{4} \times \frac{6}{5}=\frac{6}{20}=\frac{3}{10}\).
Similarly, \(\frac{8}{5} \div \frac{2}{3}=\frac{8}{5} \times\) reciprocal of \(\frac{2}{3}=\) \(\qquad\)

\section*{Do This}

Find \(\quad\) (i) \(\frac{3}{5} \div \frac{1}{2}\)
(ii) \(\frac{1}{2} \div \frac{3}{5}\)
(iii) \(2 \frac{1}{2} \div \frac{3}{5}\)
(iv) \(5 \frac{1}{6} \div \frac{9}{2}\)

Example 8: An empty swimming pool is to be filled up to \(\frac{9}{10}\) of its capacity. A pump takes half
an hour to fill \(\frac{3}{10}\) of the pool, how long will it take to fill \(\frac{9}{10}\) of the pool?
Solution : We need to find how many \(\frac{3}{10}\),s are there in \(\frac{9}{10}\).
Solve the division problem \(\frac{9}{10} \div \frac{3}{10}=\frac{{ }^{3} \not \partial}{\not \sigma_{1}} \times \frac{\not \sigma^{1}}{\not \beta_{1}}=3\).
Thus, it would take 3 half an hours i.e. \(1 \frac{1}{2}\) hours to fill the pool to its \(\frac{9}{10}\).

\section*{Exercise - 2.4}
1. Write the reciprocals for the following fractions.
(i) \(\frac{5}{8}\)
(ii) \(\frac{8}{7}\)
(iii) \(\frac{13}{7}\)
(iv) \(\frac{3}{4}\)
2. Find the following.
(i) \(18 \div \frac{3}{4}\)
(ii) \(8 \div \frac{7}{3}\)
(iii) \(3 \div 2 \frac{1}{3}\)
(iv) \(5 \div 3 \frac{4}{7}\)
3. Find the following.
(i) \(\frac{2}{5} \div 3\)
(ii) \(\frac{7}{8} \div 5\)
(iii) \(\frac{4}{9} \div \frac{4}{5}\)
4. Form 5 problems each similar to questions 1,2 and 3 and find their solutions.
5. Deepak can paint \(\frac{2}{5}\) of a house in one day. If he continues working at this rate, how many days will he take to paint the whole house?

\subsection*{2.3 Decimal numbers or Fractional decimals}

In class VI we have learnt about decimal numbers and their addition and subtraction. Let us review our understanding and then learn about multiplication and division.

Let us write 12714 in its expanded form:
\[
12714=1 \times 10000+2 \times 1000+7 \times \ldots \ldots+1 \times \ldots \ldots+4 \times 1
\]

What will the expended form of 12714.2 be?
You will find that on moving from right to left, the value increase in multiples of 10 .

Now, what happens when we move from left to right? You will find that the value gets, divided by 10. Now think, if the unit is divided by 10 , what will happen? Remember you have learnt that \(1 \div 10=\frac{1}{10}=0.1\)

Thus, the expanded form of 12714.2 is
\(12714.2=1 \times 10000+2 \times 1000+7 \times \ldots \ldots+1 \times \ldots \ldots+4 \times 1+2 \times \frac{1}{10}\)
Now find the place value of all the digits of 3.42. You might have noticed that a dot (.) or a decimal point separates whole part of the number from the fractional part. The part right side of the decimal point is called the decimal part of the number. Similarly, the part left to the decimal point is called the integral part of the number.

In the number 3.42- place value of digits.
\begin{tabular}{|c|l|l|l|}
\hline & \begin{tabular}{l}
3 is at units \\
place
\end{tabular} & \begin{tabular}{l}
4 is at the first \\
place after the \\
decimal point
\end{tabular} & \begin{tabular}{l}
2 is at the second \\
place after the \\
decimal point
\end{tabular} \\
\hline Place value & \(3 \times 1=3\) & \(4 \times \frac{1}{10}=\frac{4}{10}\) or 0.4 & \(2 \times \frac{1}{100}=\frac{2}{100}\) or 0.02 \\
\hline
\end{tabular}

\section*{Try This}
1. Look at the following table and fill up the blank spaces.
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Hundreds & Tens & Units & Tenth & \begin{tabular}{c} 
Hundredths \\
\((100)\)
\end{tabular} & \begin{tabular}{c} 
Thousandths \\
\((10)\)
\end{tabular} & Number \\
\((1)\) & \(\left(\frac{1}{10}\right)\) & \(\left(\frac{1}{100}\right)\) & \(\left(\frac{1}{1000}\right)\) & \\
\hline 5 & 4 & 7 & 8 & 2 & 9 & 547.829 \\
\hline 0 & 7 & 2 & 1 & 7 & 7 & - \\
\hline 3 & 2 & - & - & 5 & 4 & 327.154 \\
\hline 6 & - & 4 & - & 2 & - & 614.326 \\
\hline 2 & - & 6 & 5 & - & 2 & 236.512 \\
\hline
\end{tabular}
2. Write thefollowing numbers in their expanded form.
(i) 30.807
(ii) 968.038
(iii) 8370.705

To convert money, length, weight, etc from one unit to the other we often use decimals. For example, 5 paise \(=` \frac{5}{100}=` 0.05 ; 220 \mathrm{~g}=\frac{220}{1000}=0.220 \mathrm{~kg} ; 5 \mathrm{~cm}=\frac{5}{100}=0.05 \mathrm{~m}\)

\section*{Do This}

Find (i) 50 paise \(=\) \(\qquad\) (ii) \(22 \mathrm{~g}=\) \(\qquad\) kg
(iii) \(80 \mathrm{~cm}=\) \(\qquad\) m

\subsection*{2.3.1 Comparison of decimal numbers}

Let us see who has more money?
Abhishek and Neha have ` 375.50 and ` 375.75 respectively in their kiddy bank. Can you find who has more money? We first compare the digits on the left of the decimal point. Since both the children have` 375 we compare the digits to the right of the decimal point starting from the tenth place. We find that Abhishek has 7 tenths and Neha has 5 tenths, 7 tenths \(>5\) tenths, therefore, Abhishek has more money than Neha, i.e., 375.75 > 375.50.

Now compare quickly, which of the following pair of numbers is greater?
(i) 37.65 and 37.60
(ii) 1.775 with 19.780
(iii) 364.10 and 363.10

Make 15 more pairs and compare greater and smaller.
2.3.2 Let us see how to add or subtract decimals.
\begin{tabular}{rr} 
(i) & \(221.85+37.10\) \\
221.85 & (ii) \(39.70-6.85\) \\
+37.10 & 39.70 \\
258.95 & -06.85 \\
& 32.85
\end{tabular}
華荡

\section*{Do This}

Find (i) \(0.25+5.30\)
(ii) 29.75-25.97.

While adding or subtracting decimal numbers, the digits in the same places must be added or subtracted, i.e., while writing numbers one below the other, see that decimal points must come one below the other. Decimal places may be made equal by placing zeroes on the right side of the decimal number.

Example 9: The equal sides of an isosceles triangle are 3.5 cm each and the other side is 2.5 cm . What is the perimeter of the triangle?

Solution: The sides of isosceles triangle are \(3.5 \mathrm{~cm}, 3.5 \mathrm{~cm}\) and 2.5 cm . Therefore, the perimeter of the given triangle is \(=\) sum of lengths of three sides \(=3.5 \mathrm{~cm}+3.5 \mathrm{~cm}\) \(+2.5 \mathrm{~cm}=9.5 \mathrm{~cm}\)

\section*{Exercise - 2.5}
1. Which one is greater?
(i) 0.7 or 0.07
(ii) 7 or 8.5
(iii) 1.47 or 1.51
(iv) 6 or 0.66
2. Express the following as rupees using decimals.
\[
\begin{aligned}
& 1 \mathrm{~cm}=10 \mathrm{~mm} \\
& 1 \mathrm{~m}=100 \mathrm{~cm} \\
& 1 \mathrm{~km}=1000 \mathrm{~m} \\
& 1 \mathrm{~kg}=1000 \mathrm{gm}
\end{aligned}
\]
(i) 9 paise
(ii) 77 rupees 7 paise
(iii) 235 paise
3. (i) Express 10 cm in metre and kilometre.
(ii) Express 45 mm in centimeter, meter and kilometer.
4. Express the following in kilograms.
(i) 190 g
(ii) 247 g
(iii) 44 kg 80 gm
5. Write the following decimal numbers in expanded form.
(i) 55.5
(ii) 5.55
(iii) 303.03
(iv) 30.303
(v) 1234.56
6. Write the place value of \(\mathbf{3}\) in the following decimal numbers.
(i) 3.46
(ii) 32.46
(iii) 7.43
(iv) 90.30
(v) 794.037
7. Aruna and Radha start their journey from two different places. A and E. Aruna chose the path from A to B then to C, while Radha chose the path from E to D then to C . Find who travelled more and by how much?

8. Upendra went to the market to buy vegetables. He brought 2 kg 250 gm tomatoes, 2 kg 500 gm potatoes, 750 gm lady fingers and 125 gm green chillies. How much weight did Upendra carry back to his house?

\subsection*{2.4 Multiplication of decimal numbers}

Rajendra of class 7 went with his mother to the bazar to buy vegetables. There they purchased 2.5 kg potatoes at the rate of ₹ 8.50 per kg. How much money do they need to pay?
We come across various situations in day-to-day life where we need to know how to multiply two decimals. Let us now learn the multiplication of two decimal numbers.
Let us first multiply- \(0.1 \times 0.1\)
0.1 means one part of 10 parts. This is represented as \(\frac{1}{10}\) using fractions and pictorially in Fig. 1.
Thus, \(0.1 \times 0.1=\frac{1}{10} \times \frac{1}{10}\) which means \(\frac{1}{10}\) of \(\frac{1}{10}\). So here we are finding the 10th part of \(\frac{1}{10}\). Thus, we divide \(\frac{1}{10}\) into 10 equal parts and take one part. This is represented by one square in Figure 2. How many squares are there in Figure 2? There are 100 squares. So one square represents one out of 100 i.e. \(\frac{1}{100}\). So we can conclude that \(0.1 \times 0.1=\frac{1}{10} \times \frac{1}{10}=\frac{1}{100}=0.01\).

Figure 1

Figure 1

Let us now find \(0.4 \times 0.2\)
\(0.4 \times 0.2=\frac{4}{10} \times \frac{2}{10}\) or \(\frac{4}{10}\) of \(\frac{2}{10}\)
Pictorially

\(\frac{2}{10}\)

\(\frac{4}{10}\) of \(\frac{2}{10}\)

Since there are 8 double shaded squares out of 100 , they represent 0.08 . While finding \(0.1 \times 0.1\) and \(0.4 \times 0.2\), you might have noticed that we first multiplied them as Whole numbers ignoring the decimal point. In \(0.1 \times 0.1\), we found \(01 \times 01\) or \(1 \times 1\). Similarly in \(0.4 \times 0.2\) we found \(04 \times 02\) or \(4 \times 2\). The products obtained are 1 and 8 respectively.

We then counted the total number of digits to the right of the decimal point in the numbers being multiplied. In both \(0.1 \times 0.1\) and \(0.4 \times 0.2\), the total number of digits to the right of the decimal point in the numbers being multiplied is 2 each. Thus, in each of their products we put the decimal point by counting two places from right to left.

Thus, \(0.1 \times 0.1=.01\) or 0.01
\[
0.4 \times 0.2=.08 \text { or } 0.08
\]

For any decimal number which has no integral number part, we generally place a zero on the left side of decimal point to give prominance to decimal point.

If we had multiplied \(0.5 \times 0.05\) then we would have put the decimal point in the product by counting three places from right to left i.e. \(0.5 \times 0.05=0.025\).

Let us now find \(1.2 \times 2.5\)
Multiply 12 and 25 . We get 300 . In both 1.2 and 2.5 , there is 1 digit to the right of the decimal point. So, count \(1+1=2\) digits. From the rightmost digit (i.e., 0 ) in 300 , move two places towards left. We get 3.00 or 3 . Thus, \(1.2 \times 2.5=3\)

While multiplying 2.5 and 1.25 you will first multiply 25 and 125 . For placing the decimal in the product obtained, we will count \(1+2=3\) (Why?). Thus, \(2.5 \times 1.25=3.225\).

\section*{Do These}
\(\begin{array}{llll}\text { 1. Find } & \text { (i) } 1.7 \times 3 & \text { (ii) } 2.0 \times 1.5 & \text { (iii) } 2.3 \times 4.35\end{array}\)
2. Arrange the products obtained in (1) in descending order.

Example 10 : The length of a rectangle is 7.1 cm and its breadth is 2.5 cm . What is the area of the rectangle?

Solution : Length of the rectangle \(\quad=7.1 \mathrm{~cm}\)
Breadth of the rectangle \(\quad=2.5 \mathrm{~cm}\)
Therefore, area of the rectangle \(=7.1 \times 2.5=17.75 \mathrm{~cm}^{2}\)

\subsection*{2.4.1 Multiplication of decimal number by \(10,100,1000\) etc.,}

Reshma observed that \(3.2=\frac{32}{10}\) whereas \(2 \cdot 35=\frac{235}{100}\). Thus, she found that depending on the position of the decimal point, the decimal number can be converted to a fraction with denominator 10 or 100 etc., She wondered what would happen if a decimal number is multiplied by 10,100 or 1000 etc.,

Let us see if we can find a pattern in multiplying numbers by 10 or 100 or 1000 .
Have a look at the table given below and fill in the blanks :
\begin{tabular}{|l|l|l|l|}
\hline \(1.76 \times 10=\frac{176}{100} \times 10=17.6\) & \(2.35 \times 10=\ldots \ldots \ldots\) & \(12.356 \times 10=\ldots \ldots \ldots\) \\
\(1.76 \times 100=\frac{176}{100} \times 100=176\) or 176.0 & \(2.35 \times 100=\ldots \ldots \ldots\). & \(12.356 \times 100=\ldots \ldots .\). \\
\(1.76 \times 1000=\frac{176}{100} \times 1000=1760\) or & \(2.35 \times 1000=\ldots \ldots \ldots\). & \(12.356 \times 1000=\ldots \ldots .\). \\
1760.0 & \(;\) & \(0.5 \times 1000=\ldots \ldots \ldots\) \\
\hline
\end{tabular}

Look at your answers. Could you find any pattern? The decimal point in the products shifts to the right by as many zeroes as in \(10,100,1000 \ldots .\). etc.

\subsection*{2.4.2 Division of decimal numbers}

Gopal was preparing a design to decorate his classroom. He needed a few coloured strips of paper of length 1.6 cm each. He had a strip of coloured paper of length 9.6 cm . How many pieces of the required length will he get out of this strip? He thought it would be \(\frac{9.6}{1.6} \mathrm{~cm}\). Is he correct? Both 9.6 and 1.6 are decimal numbers. So we need to know the division of decimal numbers too!

\subsection*{2.4.2 (a) Division by numbers like \(10,100,1000\)}
\(\qquad\)
Let us now divide a decimal number by 10,100 and 1000 .
Consider \(31.5 \div 10\).
\(31.5 \div 10=\frac{315}{10} \div 10=\frac{315}{10} \times \frac{1}{10}=\frac{315}{100}=3.15\)

Similarly, \(31.5 \div 100=\frac{315}{10} \div 100=\frac{315}{10} \times \frac{1}{100}=\frac{315}{1000}=0.315\)
Is there a pattern while dividing numbers by 10,100 or 1000 ? This may help us in dividing numbers by 10,100 or 1000 in a shorter way.

Observe the pattern in the table given below and complete it.
\begin{tabular}{|l|l|l|l|}
\hline \(29.5 \div 10=2.95\) & \(132.7 \div 10=\ldots \ldots \ldots\). & \(1.5 \div 10=\ldots \ldots \ldots\). & \(17.36 \div 10=\ldots \ldots \ldots .\). \\
\(29.5 \div 100=0.295\) & \(132.7 \div 10=\ldots \ldots \ldots\). & \(1.5 \div 100=\ldots \ldots \ldots\). & \(17.36 \div 100=\ldots \ldots \ldots .\). \\
\(29.5 \div 1000=0.0295\) & \(132.7 \div 1000=\ldots \ldots \ldots .\). & \(1.5 \div 1000=\ldots \ldots \ldots\) & \(17.36 \div 1000=\ldots \ldots \ldots\). \\
\hline
\end{tabular}

\subsection*{2.4.2 (b) Division of a decimal number by a whole number}

Let us find \(\frac{6.4}{2}\). Remember we also write it as \(6.4 \div 2\).
So, \(6.4 \div 2=\frac{64}{10} \div 2=\frac{64}{10} \times \frac{1}{2}\) (division of fraction using reciprocal)
\(=\frac{64 \times 1}{10 \times 2}=\frac{1 \times 64}{10 \times 2}=\frac{1}{10} \times \frac{64}{2}=\frac{1}{10} \times 32=\frac{32}{10}=3.2\)
Similarly, \(12.96 \div 4=\frac{1296}{100} \div 4=\frac{1296}{100} \times \frac{1}{4}=\frac{1}{100} \times \frac{1296}{4}=\frac{1}{100} \times 324=3.24\)

\section*{Do This}
1. Find (i) \(35.7 \div 3\)
(ii) \(25.5 \div 3\)

Example 11: Find the average of 4.2, 3.8 and 7.6.
Solution : The average of \(4.2,3.8\) and \(7.6=\frac{4.2+3.8+7.6}{3}=\frac{15.6}{3}=5.2\)

\subsection*{2.4.2 (c) Division of a decimal number by another decimal number}

Let us find how we divide a decimal number by another decimal number,
For example \(35.5 \div 0.5 .=\frac{355}{10} \div \frac{5}{10}=\frac{355}{10} \times \frac{10}{5}=71\)
Thus \(35.5 \div 0.5=71\).

Example 12 : A bus covers a distance of 92.5 km in 2.5 hours. If the bus is travelling at the same speed through out the journey what is the distance covered by it in 1 hour?

Solution : Distance travelled by the bus \(=92.5 \mathrm{~km}\).

Time required to travel this distance \(\quad=2.5\) hours.

So distance travelled by it in 1 hour \(\quad=\frac{92.5}{2.5}=\frac{925}{25}=37 \mathrm{~km}\).

\section*{Exercise - 2.6}
1. Solve the following.
(i) \(0.3 \times 6\)
(ii) \(7 \times 2.7\)
(iii) \(2.71 \times 5\)
(iv) \(19.7 \times 4\)
(v) \(0.05 \times 7\)
(vi) \(210.01 \times 5\)
(vii) \(2 \times 0.86\)
2. Find the area of a rectangle whose length is 6.2 cm and breadth is 4 cm .
3. Solve the following.
(i) \(21.3 \times 10\)
(ii) \(36.8 \times 10\)
(iii) \(53.7 \times 10\)
(iv) \(168.07 \times 10\)
(v) \(131.1 \times 100\)
(vi) \(156.1 \times 100\)
(vii) \(3.62 \times 100\)
(viii) \(43.07 \times 100\)
(ix) \(0.5 \times 10\)
(x) \(0.08 \times 10\)
(xi) \(0.9 \times 100\)
(xii) \(0.03 \times 1000\)
4. A motor bike covers a distance of 62.5 km .consuming one litre of petrol. How much distance does it cover for 10 litres of petrol?
5. Solve the following.
(i) \(1.5 \times 0.3\)
(ii) \(0.1 \times 47.5\)
(iii) \(0.2 \times 210.8\)
(iv) \(4.3 \times 3.4\)
(v) \(0.5 \times 0.05\)
(vi) \(11.2 \times 0.10\)
(vii) \(1.07 \times 0.02\)
(viii) \(10.05 \times 1.05\)
(ix) \(101.01 \times 0.01\)
(x) \(70.01 \times 1.1\)
6. Solve the following.
(i) \(2.3 \div 100\)
(ii) \(0.45 \div 5\)
(iii) \(44.3 \div 10\)
(iv) \(127.1 \div 1000\)
(v) \(7 \div 3.5\)
(vi) \(88.5 \div 0.15\)
(vii) \(0.4 \div 20\)
7. A side of a regular polygon is 3.5 cm in length. The perimeter of the polygon is 17.5 cm . How many sides does the polygon have?
8. A rain fall of 0.896 cm . was recorded in 7 hours, what was the average amount of rain per hour?

\subsection*{2.5 Introduction to Rational numbers}
2.5.1 Positive fractional numbers

We have learnt about integers and fractions. Let us see how the number line looks when both are marked on it.

We have \(\frac{1}{4}, \frac{2}{4}, \frac{3}{4} \ldots .\). between 0 and 1 on the number line. All these are numbers that are less than one. We call them as proper fractions and say that all proper fractions lie between 0 and 1 . Similarly, we know \(\frac{4}{3}\) and \(\frac{5}{3}\) would lie between 1 and 2 . We can recall them as improper fractions. All these are called positive fractional numbers.

\section*{Do These}
1. Write any 5 more fractions between (i) 0 and 1 and (ii) 1 and 2 .
2. Where does \(4 \frac{3}{5}\) lie on the number line?

On the left side of 0 we have integers \(-1,-2,-3 \ldots \ldots\)
Do the numbers increase or decrease as we move further left on the number line?
You know that number decreases as we move further left. The farther the number is from 0 on the left the smaller it is.

\section*{Do These}
1. Find the greatest and the smallest numbers among the follwing groups.
(i) \(2,-2,-3,4,0,-5\)
(ii) \(-3,-7,-8,0,-5,-2\)
2. Write the following numbers in ascending order.
(i) \(-5,-75,3-2,4, \frac{3}{2}\)
(ii) \(\frac{2}{3}, \frac{3}{2}, 0,-1,-2,5\)

\subsection*{2.5.2 Negative fractional numbers}

Consider the point ' A ' shown on the line.

It lies on the number line between 0 and -1 . Is it more than 0 or less than 0 ?
Is it \(\frac{1}{2}\) ? We cannot say it is \(\frac{1}{2}\) as it is less than zero.
We write A as \(-\frac{1}{2}\) since it is \(\frac{1}{2}\) less than zero.
Similarly, B the mid point of -1 and -2 is. \(-\frac{3}{2}\)
Neha found an easy way to represent \(\frac{-9}{4}\). She first wrote it in a mixed fraction \(\frac{-9}{4}=-2 \frac{1}{4}\) and then represented it between -2 and -3 .

You can see that negative fractional numbers like \(-\frac{1}{2},-\frac{3}{2},-\frac{9}{4}\) give us points in between any two negative integers or between zero and a negative integer.

\section*{Do These}
1. On the number line given below represent the following numbers.
(i) \(\frac{-5}{4}\)
(ii) \(\frac{3}{2}\)
(iii) \(\frac{7}{4}\)
(iv) \(\frac{-7}{4}\)
(v) \(\frac{-1}{4}\)
(vi) \(\frac{1}{4}\)

Make a longer number line and represent more positive and negative numbers on it.
2. Consider the following numbers on a number line.
\(27,-\frac{7}{8}, \frac{11}{943}, \quad \frac{54}{17}, \quad-68,-3,-\frac{9}{6}, \quad \frac{7}{2}\)
(i) Which of these are to the left of
(a) 0
(b) -2
(c) 4
(d) 2
(ii) Which of these would be to the right of
(a) 0
(b) -5
(c) \(3 \frac{1}{2}\)
(d) \(\frac{-5}{2}\)

\subsection*{2.5.3 Rational Numbers}

We know \(0,1,2,3,4,5\) are whole numbers. We also know that \(\ldots .-5,-4,-3,-2,-1,0,1,2\), \(3,4,5 \ldots\) is a bigger collection of numbers called integers.

Rani says "All whole numbers are integers but the converse is not true." Do you agree with her? Rani is right as negative numbers like \(-6,-5,-4,-3,-2,-1\) etc are integers but not whole numbers. Thus, all whole numbers are integers and all integers are not whole numbers.

We further know that positive fractional numbers like \(\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{5}{6}, \frac{11}{5}, \frac{8}{8}\) are ratios of whole numbers. All fractional numbers can in general be written as \(\frac{w_{1}}{w_{2}}\) with the condition \(w_{1}\) and \(w_{2}\) are whole numbers and that \(w_{2}\) is not equal to zero.

\section*{Try This}

Write 5 fractional numbers and identify \(w_{1}\) and \(w_{2}\) in each of these.

Rational numbers are a bigger collection of numbers, which includes all integers, all positive fractional numbers and all negative fractional numbers.

Thus, the numbers \(\frac{-7}{3}, \frac{-5}{2}, \frac{-7}{7}, \frac{-2}{7}, 0, \frac{1}{4}, \frac{4}{4}, \frac{17}{5}, \frac{6}{1}\) etc. are all rational numbers.
In all these we have a ratio of two integers, thus the numbers in the form of \(\frac{p}{q}\), where \(p\) and \(q\) are integers except that \(q\) is not equal to zero are called as rational numbers. The set of rational numbers is denoted by ' \(Q\) '.

\section*{Try These}
(i) Take any 5 integers and make all possible rational numbers with them.
(ii) Consider any 5 rational numbers. Find out which integers constitute them?

\subsection*{2.5.4 Comparing rational numbers}

We know that \(\frac{3}{4}\) and \(\frac{9}{12}\) are equivalent fractional numbers. We also know that when we compare fractional numbers we convert each of them to equivalent fractional numbers and then compare the ones with a common denominator.

For example, let us compare \(\frac{3}{4}\) and \(\frac{5}{7}\).
We write equivalent fractional numbers for both
\(\frac{3}{4}=\frac{6}{8}, \frac{9}{12}, \frac{12}{16}, \frac{15}{20}, \frac{18}{24}, \frac{21}{28}\) and
\(\frac{5}{7}=\frac{10}{14}, \frac{15}{21}, \frac{20}{28} \ldots \ldots\).
We can compare \(\frac{21}{28}\) with \(\frac{20}{28}\) as they have same denominators.
\(\frac{21}{28}\) is bigger than \(\frac{20}{28}\)
Therefore, \(\frac{3}{4}>\frac{5}{7}\)

\section*{Try These}
1. Write three more equivalent fractions of \(\frac{3}{4}\) and mark them on the number line. What do you observe?
2. Do all equivalent fractions of \(\frac{6}{7}\) represent the same point on the number line?

Now compare \(\frac{-1}{2}\) and \(\frac{-2}{3}\)
We write equivalent fractions for both
\(\frac{-1}{2}=\frac{-2}{4}, \frac{-3}{6}, \frac{-4}{8} \ldots \ldots \ldots\)
\(\frac{-2}{3}=\frac{-4}{6}, \frac{-6}{9}\) \(\qquad\)

We can compare \(\frac{-3}{6}\) and \(\frac{-4}{6}\) as they have same denominators.
\(\frac{-4}{6}<\frac{-3}{6} \quad\left(\frac{-4}{6}\right.\) is left of \(\frac{-3}{6}\) on the number line \()\)
\(\therefore \frac{-2}{3}<\frac{-1}{2}\)

\section*{Try These}
1. Are \(\frac{-1}{2}\) and \(\frac{-3}{6}\) represent same point on the number line?
2. Are \(\frac{-2}{3}\) and \(\frac{-4}{6}\) equivalent?

Eg: When we place \(\frac{-1}{2}\) and \(\frac{-2}{4}\) on the number line we find that they occupy the same point. Thus We can say that these two are equivalent rational numbers.

\section*{Do These}
1. Write 5 equivalent rational numbers to (i) \(\frac{5}{2}\) (ii) \(\frac{-7}{9}\) (iii) \(-\frac{3}{7}\)
2. Identify the equivalent rational numbers in each of the following:
(i) \(\frac{-1}{2}, \frac{-3}{4}, \frac{-2}{4}, \frac{-4}{8}\)
(ii) \(\frac{1}{4}, \frac{3}{4}, \frac{5}{3}, \frac{10}{6}, \frac{2}{4}, \frac{20}{12}\)

We can say that to get equivalent rational numbers we multiply or divide the integer in the numerator and in the denominator by the same number.

For example,
For \(\frac{1}{5}\) we would have \(\frac{1 \times 2}{5 \times 2}=\frac{2}{10}\) as one equivalent number and another is \(\frac{1 \times 3}{5 \times 3}=\frac{3}{15}\).

For \(\frac{-2}{7}\) we would have \(\frac{-2 \times 2}{7 \times 2}=\frac{-4}{14}\) as one and \(-\frac{2 \times 3}{7 \times 3}=\frac{-6}{21}\) as another.
We can go on to build more such equivalent rational numbers, just by multiplying with \(\frac{1}{1}=\frac{2}{2}=\frac{3}{3}=\frac{4}{4} \ldots\)

\section*{Exercise 2.7}
1. Write any three equivalent rational numbers to each of the following
(i) \(\frac{2}{3}\)
(ii) \(-\frac{3}{8}\)
2.
(i) Write the equivalent rational number for \(\frac{-15}{36}\) with denominator 12.
(ii) Write the equivalent rational number for \(\frac{-15}{36}\) with numerator -75 .
3. Mark the following rational numbers on the number line.
(i) \(\frac{1}{2}\)
(ii) \(\frac{3}{4}\)
(iii) \(\frac{3}{2}\)
(iv) \(\frac{10}{3}\)
4. Find whether the following statements are true or false.
(i) Every integer is a rational number and vice versa
(ii) In a rational number of the form \(\frac{p}{q}\), \(q\) must be a non zero integer.
(iii) \(\frac{5}{7}, \frac{6}{7}, \frac{7}{7}\) are equivalent rational numbers.
(iv) Equivalent rational numbers of a positive rational numbers are all positive

\subsection*{2.5.5 Addition and Subtraction of Rational Numbers}

You have learnt the addition and subtraction of fractional numbers. We can perform these operations on rational numbers also in a similar manner.

\section*{Addition of Rational Numbers}

Consider two rational numbers \(\frac{5}{6}\) and \(\frac{3}{8}\).
What is the sum of these two rational numbers?
\(\frac{5}{6}+\frac{3}{8}\)
To add, we have to take the LCM of the denominators as we do for fractional numbers.
Here LCM of 6,8 is \(=24\)
First divide the LCM with each of the denominators seperately i.e.
\(24 \div 6=4\)
\(24 \div 8=3\)
Now, we will multiply the corresponding denominators, numerators with appropriate quotients.
then, we get \(\frac{5}{6}+\frac{3}{8}=\frac{5 \times 4}{6 \times 4}+\frac{3 \times 3}{8 \times 3}\)
\(=\frac{20}{24}+\frac{9}{24}\)
\(=\frac{20+9}{24}=\frac{29}{24}\)
Now, let us add \(\frac{5}{6}\) and \(\frac{-3}{8}\)
\[
\begin{aligned}
\frac{5}{6}+\left(-\frac{3}{8}\right) & =\left(\frac{5 \times 4}{6 \times 4}\right)+\left(\frac{-3 \times 3}{8 \times 3}\right) \\
& =\frac{20}{24}+\left(\frac{-9}{24}\right)=\frac{20+(-9)}{24}=\frac{11}{24}
\end{aligned}
\]

We can do like this way also
\[
\begin{aligned}
\frac{5}{6}+\left(\frac{-3}{8}\right) & =\frac{(5 \times 4)+(-3 \times 3)}{24} \\
& =\frac{20+(-9)}{24}=\frac{11}{24}
\end{aligned}
\]
\begin{tabular}{ll} 
(i) \(\frac{4}{9}+\left(\frac{-5}{12}\right)\) & (ii) \\
(idd \(\frac{-3}{5}\) and \(\frac{-7}{15}\) \\
(iii) \(\frac{-10}{11}+\frac{7}{10}\) & (iv) \(\frac{-8}{15}+\left(\frac{-7}{20}\right)\)
\end{tabular}

\section*{Think And Discuss}
1. Is the sum of two natural numbers always more than the individual numbers.
2. If your answer is yes, then is this statement true for integers also?
3. Is this true for rational numbers also?
2.5.6 Subtracting Rational Numbers

Let us take the same rational numbers i.e. \(\frac{5}{6}\) and \(\frac{3}{8}\)
Now, subtract \(\frac{3}{8}\) from \(\frac{5}{6}\)
\[
\begin{aligned}
\frac{5}{6}-\frac{3}{8} & =\frac{(5 \times 4)-(3 \times 3)}{24} \quad(\text { LCM of } 6,8 \text { is } 24) \\
& =\frac{20-9}{24}=\frac{11}{24}
\end{aligned}
\]

\section*{Example:}
(i) Subtract \(\left(\frac{-3}{8}\right)\) from \(\frac{5}{6}\)
\[
\begin{aligned}
\frac{5}{6}-\left(\frac{-3}{8}\right) & =\frac{(5 \times 4)-(-3 \times 3)}{24} \\
& =\frac{20-(-9)}{24} \\
& =\frac{20+(9)}{24}=\frac{29}{24}
\end{aligned}
\]

\section*{Do This}
(i) \(\frac{7}{16}-\left(\frac{-5}{12}\right)=\) ?
(ii) Subtract \(\frac{-12}{7}\) from \(\frac{15}{4}\)
(iii) \(\frac{-8}{15}-\left(\frac{6}{21}\right)=\) ?

\section*{Think And Discuss}
(i) Is the difference of two natural numbers always smaller than the given individual numbers?
(ii) Is this true for integers also?
(iii) Is this true for rational numbers also?

\section*{Looking back}
1. For doing addition and subtraction of fractions, first convert them into like fractions.
2. We have also learnt how to multiply fractions i.e.

A7G5I2
Multiplication of two fractions \(=\frac{\text { Product of numerators }}{\text { Product of denominators }}\)
3. "of" can be used to represent multiplication.

For example, \(\frac{1}{3}\) of \(6=\frac{1}{\not \partial} \times \mathscr{\phi}^{2}=2\).
4. The product of two proper fractions is less than each of the fractions that are multiplied. The product of a proper and improper fraction is less than the improper fraction and greater than the proper fraction. The product of two improper fractions is greater than each of the fractions.
5. A reciprocal of a fraction is obtained by inverting the numerator and denominator.
6. We have seen how to divide two fractions.
(i) While dividing a whole number with a fraction, we multiply the whole number with the reciprocal of that fraction.
(ii) While dividing a fraction by a whole number we multiply the fraction with the reciprocal of the whole number.
(iii) While dividing one fraction by another fraction, we multuiply the first fraction with the reciprocal of the second. For example, \(\frac{3}{4} \div \frac{5}{7}=\frac{3}{4} \times \frac{7}{5}=\frac{21}{20}\).
7. We also learnt how to multiply two decimal numbers. While multiplying two decimal numbers, we first multiply them as whole numbers. We then count the total number of digits to the right of the decimal point in both the decimal numbers being multiplied. Lastly, we put the decimal point in the product by counting the digits fromits rightmost place.
8. To multiply a decimal number by \(10,100,1000\)... etc., we move the decimal point in the number to the right by as many places as there are zeros in the numbers \(10,100,1000 \ldots\)
9. We have learnt how to divide decimal numbers.
(i) To divide a decimal number by a whole number, we first divide them as whole numbers. We then place the decimal point in the quotient as in the decimal number.

Note that here we are considering only those divisions in which the remainder is zero.
(ii) To divide a decimal number by \(10,100,1000\) or any other multiple of 10 , we shift the decimal point in the decimal number to the left by as many places as there are zeros in 10, 100, 1000 etc.,
(iii) While dividing two decimal numbers, first shift the decimal point to the right by equal number of places in both, to convert the divisor to a whole number.
10. Rational numbers are a bigger collection of numbers, which includes all integers, all positive fractional numbers and all negative fractional numbers. \(\frac{-7}{3}, \frac{-5}{2}, \frac{-7}{7}, \frac{-2}{7}, 0, \frac{1}{4}, \frac{4}{4}, \frac{17}{5}, \frac{6}{1}\) are all rational numbers. In all these we have a ratio of two integers, thus \(\frac{p}{q}\) represents a rational number.
Inthis
i) \(p, q\) are integers and
ii) \(q \neq 0\)

The set of rational numbers is denoted by ' Q '.

Iofin Napier (Scotland)
1550-1617 AD
Found logarithms.
Introduced napier rods for multiplictions.

\(\mathcal{A l s o}\) introduced System of decimalfractions.

\subsection*{3.0 Introduction}

You have already come across simple equations like \(4 x=44,2 \mathrm{~m}=10\) and their solutions in Class VI. You have seen how these equations help us in solving puzzles and daily life problems. Let us review what we have already learnt about simple equations and their solutions through the following exercise.

\section*{Exercise - 3.1}
1. Identify L.H.S and R.H.S of the following simple equations.
(i)
(ii) \(2 x-3=9\)
(iii) \(4 \mathrm{z}+1=8\)
(iv) \(5 \mathrm{p}+3=2 \mathrm{p}+9\)
(v) \(14=27-y\)
(vi) \(2 a-3=5\)
(vii) \(7 \mathrm{~m}=14\)
(viii) \(8=\mathrm{q}+5\)
2. Solve the following equations by trial and error method.
(i) \(2+y=7\)
(ii) \(a-2=6\)
(iii) \(5 \mathrm{~m}=15\)
(iv) \(2 \mathrm{n}=14\)

\subsection*{3.1 Equation - Weighing balance}

You have seen in class VI that an equation is compared with a weighing balance with equal weights on both sides.

What will happen if the left pan of a weighing balance holds 5 kg and the right pan holds 2 kg ? What will happen if the left pan of a weighing balance holds 3 kg and the right pan holds 7 kg ?

Similarly, what will happen if the left pan of a weighing
 balance holds 3 kg and the right pan holds 3 kg ?

We observe that a weighing balance needs to have equal weights on both sides to be perfectly balanced.

The same principle will hold in an equality.

Consider the equality \(12-2=6+4\)
Here-
LHS \(=12-2=10\) and
RHS \(=6+4=10\)
Since both sides are equal, the equality holds.
1. What will happen if we add 3 on both sides of an equation? Will the values of both sides remain equal? Will the values be equal if 10 is added? Try with some other number of your choice.
2. What will happen if we subtract 5 from both sides of the equation? Will both sides remain equal? Will the values be equal if 7 is subtracted?Try with some other numbers of your choice.
3. What will happen if we multiply both sides of the equation by 6 ? Will both sides remain equal? Will they be equal if 8 multiplied by 8 ? Try with some other numbers of your choice.
4. What will happen if we divide both sides of the equation by 5 ? Will both sides remain equal? Will they be equal if both sides are divided by 2 ?

You will find that answer is 'yes' in all above cases. Thus, if the same number is added or subtracted on both sides or if both sides of the equality are either multiplied or divided by same number, then the equality remains unchanged.

This principle of equality is going to help in solving equations ahead.

\subsection*{3.2 Solving equations}

You have already learnt how to solve equations using the trial and error method. Now we will use the above principles of equality to solve equations in a much lesser time.

To solve equations we first need to separate the numerical terms from the terms containing variables/unknowns by taking them on the two different sides of the equality and then use the principles of equality.

Let us observe the examples given below.

\section*{Example 1: Solve \(x+3=7\)}

Solution: Given equation is
\(x+3=7\)
The L.H.S of the equation \(=x+3\).
Total value of L.H.S. is 3 more than \(x\)
To find the value of 'x' we have to remove 3 from the LHS. Thus, we need to subtract 3 from the LHS. If 3 is subtracted fromLHS it should also be subtracted from RHS, to balance the equality.

We have, \(\quad x+3=7\)
\[
\begin{array}{r}
x+3-3=7-3 \\
x=7-3 . \tag{2}
\end{array}
\]
\[
x=4
\]

Thus,
\[
x=4 .
\]

From (1) and (2) it is clear that removing ' +3 'from LHS is equivalent to 'subtracting 3 ' from the RHS. That means ' +3 ' on LHS transposes as ' -3 ' to RHS.

Check: Substitute '4' for ' \(x\) ' and check whether LHS = RHS.
\[
\begin{aligned}
\text { LHS } & =x+3 \\
& =4+3 \quad \text { (substituting } x=4 \text { ) } \\
& =7
\end{aligned}
\]

RHS \(=7\)
Thus, LHS = RHS.
Let us also understand the above solution with a weighing balance:

Example 2: Solve \(y-7=9\)
Solution :
\[
\begin{equation*}
y-7=9 \tag{1}
\end{equation*}
\]

Here the L.H.S of the equation \(=y-7\)
So to get the value of ' \(y\) ' we have to add 7 on both sides of the equation.
Therefore, \(\quad y-7+7=9+7\)
\[
\begin{gather*}
y=9+7  \tag{2}\\
y=16
\end{gather*}
\]

From (1) and (2) it is clear that ' -7 'on LHS transposing to RHS as ' +7 '.

Thus, \(\quad y=16\).
Check : Substitute '16' for ' \(y\) ' and check whether LHS = RHS.

Example 3: Solve \(5 x=-30\)
Solution: \(5 x=-30\)
\[
\begin{align*}
\frac{5 x}{5} & =\frac{-30}{5} \quad(\text { dividing both sides by } 5)  \tag{1}\\
x & =\frac{-30}{5} \ldots \ldots \ldots \ldots \ldots \ldots . . . . . . . . . . . .(2)  \tag{2}\\
\therefore x & =-6
\end{align*}
\]

From (1) and (2) it is clear that multiplier ' 5 'on LHS transposed to RHS as 'divisor'.

Check: Substitute \(x=-6\) in the equation and check whether LHS \(=\) RHS.
Example 4: Solve \(\frac{z}{6}=-3\)

Solution : \(\quad \frac{z}{6}=-3\) \(\qquad\)
\[
6\left(\frac{z}{6}\right)=6 \times(-3) \quad(\text { multiplying both sides by } 6)
\]
\[
\begin{equation*}
z=6 \times(-3) \tag{2}
\end{equation*}
\]
\[
\therefore \quad z=-18
\]

From (1) and (2) it is clear that divison ' 6 ' on LHS transposed to RHS as 'multipier 6'.

Check: Substitute \(z=-18\) in the equation and check whether LHS \(=\) RHS.
Example 5: Solve \(3 x+5=5 x-11\)
Solution
\[
3 x+5=5 x-11
\]
\[
3 x+5-5 x=5 x-11-5 x \quad \text { (subtracting } 5 x \text { from both sides) }
\]
\[
-2 x+5=-11
\]
\[
\begin{aligned}
-2 x+5-5 & =-11-5 \quad \text { (subtracting '5' from both sides) } \\
-2 x & =-16
\end{aligned}
\]
\[
\frac{-2 x}{-2}=\frac{-16}{-2}(\text { Dividing both sides by ' }-2 \text { ') }
\]
\[
\therefore x=8
\]

Check : Substituting \(x=8\) in the equation:
\[
\begin{aligned}
& \text { LHS }=3 x+5=3(8)+5=24+5=29 \\
& \text { RHS }=5 x-11=5(8)-11=40-11=29 \\
& \therefore \text { LHS }=\text { RHS }
\end{aligned}
\]
```

Thus, in transposing terms from L.H.S. to R.H.S.
'+ quantity' becomes '-quantity'
`- quantity' becomes '+ quantity'
' }\times\mathrm{ quantity' becomes }\div\mathrm{ quantity
``quantity' becomes ' }\times\mathrm{ quantity'

```

Example 6: Solve \(12=x+3\)
Solution: Here if 12 is moved fromLHS to RHS it becomes -12 and if \(x+3\) is moved from RHS to LHS it becomes \(-x-3\).
\[
\text { i.e } \quad-x-3=-12
\]

Multiplying both sides by -1
\[
\begin{gathered}
-1(-x-3)=-1(-12) \\
x+3=12
\end{gathered}
\]

Now \(x=12-3\)
\[
\therefore x=9
\]

Therefore, it is clear that if the terms in both L.H.S. and R.H.S. of an equation are moved (transposed) from one side to another side, then the equations remain same.

\section*{Exercise - 3.2}
1. Solve the following equations without transposing and check your result.
(i) \(x+5=9\)
(ii) \(y-12=-5\)
(iii) \(3 x+4=19\)
(iv) \(9 \mathrm{z}=81\)
(v) \(3 x+8=5 x+2\)
(vi) \(5 y+10=4 y-10\)
2. Solve the following equations by transposing the terms and check your result.
(i) \(2+y=7\)
(ii) \(2 \mathrm{a}-3=5\)
(iii) \(10-\mathrm{q}=6\)
(iv) \(2 \mathrm{t}-5=3\)
(v) \(14=27-x\)
(vi) \(5(x+4)=35\)
(vii) \(-3 x=15\)
(viii) \(5 x-3=3 x-5\)
(ix) \(3 y+4=5 y-4\)
(x) \(3(x-3)=5(2 x+1)\)

\subsection*{3.3 Using simple equations for solving day to day problems}

Look at the following examples:
(i) The total number of boys and girls in a class is 52 . If the number of girls is 10 more than boys, find the number of boys?
(ii) The present age of Ramu's father is three times that of Ramu. After five years the sum of their ages will be 70 years. Find their present ages.
(iii) A purse contains ` 250 in the denomination of ` 10 and ` 50 . If the number of ` 10 notes is one more than that of ` 50 notes find the number of notes of each denomination.
(iv) Length of a rectangle is 8 mless than twice its breadth. The perimeter of the rectangle is 56 m . Find its length and breadth.

Likes in all the problems given above, we can use simple equations to solve various problems of day to day life. The following steps can be followed in doing so
Step 1: Read the problem carefully.
Step 2 : Denote the unknown or the quantity to be found with some letters such as \(x, y, z, u, v, w, p, t\).
Step 3: Write the problem in the form of an algebraic equation by making a relation among the quantities.

Step 4: Solve the equation.
Step 5: Check the solution.
Example 7: Total number of the boys and girls in a class is 52. If the number of girls is 10 more than that of boys, find the number of boys?

Solution: Let us assume the number of boys to be \(x\).
The number of girls will be \(x+10\).
The total number of boys and girls \(=x+(x+10)\)
\[
\begin{aligned}
& =x+x+10 \\
& =2 x+10
\end{aligned}
\]

According to the question, the total number of boys and girls \(=52\).
Therefore, \(2 x+10=52\)
Solving the equation
\[
\begin{aligned}
& 2 x=52-10 \text { (transposing } 10 \text { from LHS to RHS) } \\
& 2 x=42 \\
& x=\frac{42}{2} \text { (transposing } 2 \text { fromLHS to RHS) } \\
& \therefore x=21 \\
& 66
\end{aligned}
\]

Thus, the number of boys \(=21\)
and the number of girls \(=21+10=31\)
Check : \(\quad 21+31=52\) i.e. the total number of boys and girls is 52 .
And 31-21=10 i.e. the number of girls is 10 more than the number of boys.
Example 8: The present age of Ramu's father is three times that of Ramu. After five years the sum of their ages would be 70 years. Find their present ages.

Solution: Let Ramu's present age \(=x\) years.
Then the present age of his father \(=3 x\) years.
After 5 years Ramu's age \(=x+5\) years.
His father's age
\(=3 x+5\) years .
Sum of their ages after 5 years is \(\quad=(x+5)+(3 x+5)=4 x+10\) years.
According to the problem,
Sum of their ages after 5 years is \(\quad 4 x+10=70\)
\[
\begin{aligned}
& 4 x \quad=70-10 \\
& 4 x \quad=60 \\
& x=\frac{60}{4}=
\end{aligned}
\]

Thus, Ramu's present age \(=15\) years.
Present age of his father \(=3 \times 15\) years \(=45\) years.
Check : 45 is three times of 15 i.e., at present Ramu's father is 3 times that of Ramu,
After 5 years Ramu's age \(\quad=15+5=20\) years
After 5 years his father's age \(\quad=45+5=50\) years.
Sum of their ages \(\quad=20+50=70\) years.
Example 9: A purse contains ` 250 in the denomination of ` 10 and ` 50 . If the number of ` 10 notes is one more than that of ` 50 notes, find the number of notes of each denomination.

Solution: Let the number of ` 50 notes \(=x\)
Then the total value of ` 50 notes \(=50 x\)
Number of ` 10 notes \(\quad=x+1\)
Then the total value of \({ }^{\text {` }} 10\) notes \(\quad=10(x+1)\)
\[
\begin{aligned}
\therefore \quad \text { Total value of money } & =50 x+10(x+1) \\
& =50 x+10 x+10 \\
& =60 x+10
\end{aligned}
\]

Given, total value of the money that the purse contains \(=₹ 250\)
Therefore,\(\quad 60 x+10=250\)
\[
\begin{aligned}
60 x & =250-10 \\
60 x & =240 \\
x & =\frac{240}{60} \\
\therefore x & =4
\end{aligned}
\]

Thus, the number of \({ }^{`} 50\) notes \(=4\)
Number of \({ }^{`} 10\) notes \(=4+1=5\)

Check :` 10 notes (5) are one more than ` 50 notes (4).
\[
\begin{aligned}
\text { Value of the money } & =(50 \times 4)+(10 \times 5) \\
& =200+50 \\
& =₹ 250
\end{aligned}
\]

Example 10: Length of a rectangle is 8 m less than twice its breadth. If the perimeter of the rectangle is 56 m , find its length and breadth.

Solution: Let the breadth of the rectangle \(=x \mathrm{~m}\).
Twice the breadth
Therefore, its length
Given, the perimeter of the rectangle \(=56 \mathrm{~m}\).
Perimeter of the rectangle \(\quad=2\) (length + breadth \()\)
Thus, perimeter
\[
\begin{aligned}
& =2(2 x-8+x) \mathrm{m} . \\
& =2(3 x-8) \mathrm{m} . \\
& =(6 x-16) \mathrm{m} .
\end{aligned}
\]

Therefore, \(6 x-16=56\) (Given data)
\[
\begin{aligned}
6 x & =56+16 \\
6 x & =72 \\
x & =\frac{72}{6} \\
\therefore x & =12
\end{aligned}
\]

Breadth of the rectangle \(=12 \mathrm{~m}\).
Length of the rectangle \(=2 \times 12-8=16 \mathrm{~m}\).
Check : Perimeter \(=2(\) length + breadth \()=2(16+12)=2 \times 28=56 \mathrm{~m}\).

\section*{Exercise - 3.3}

Write the information given in the picture in the form of an equation. Also, find ' \(x\) ' in the following figure.

2. Write the information given in the picture in the form of an equation. Also, find ' \(y\) ' in the following figure.

3. If we add 7 to twice a number, we get 49 . Find the number.
4. If we subtract 22 from three times a number, we get 68 . Find the number.
5. Find the number when multiplied by 7 and then reduced by 3 is equal to 53 .
6. Sum of two numbers is 95 . If one exceeds the other by 3 , find the numbers.
7. Sum of three consecutive integers is 24 . Find the integers.
8. Find the length and breadth of the rectangle given below if its perimeter is 72 m .

9. Length of a rectangle exceeds its breadth by 4 m . If the perimeter of the rectangle is 84 m , find its length and breadth.
10. After 15 years, Hema's age will become four times that of her present age. Find her present age.
11. A sum of ₹ 3000 is to be given in the form of 63 prizes. If the prize money is either ₹ 100 or ₹ 25 . Find the number of prizes of each type.
12. A number is divided into two parts such that one part is 10 more than the other. If the two parts are in the ratio 5:3, find the number and the two parts.
13. Suhana said, "multiplying my number by 5 and adding 8 to it gives the same answer as subtracting my number from 20".
Find Suhana's number.
14. The teacher tells in the class that the highest marks obtained by a student in her class is twice the lowest marks plus 7 . The highest mark scored by the student is 87 . What is the lowest mark scored by the student?
15. In adjacent figure, find the magnitude of each of the three angles formed?
(Hint: Sum of all angles at a point on a line is \(180^{\circ}\) )
16. Solve the following riddle:

I am a number
Tellmy identity.
Take me two times over
And add a thirty six.
To reach a century
You still need four.

\section*{Looking Back}

Simple equations help in solving various problems in daily life.
For balancing an equation we

(i) add the same number on both the sides or
(ii) subtract the same number form both the sides or
(iii) multiply both sides with the same number or
(iv) divides both the sides by the same number, so that the equality remains undisturbed.
- If the LHS and the RHS are interchanged, then the equation remains same.

\subsection*{4.0 Introduction}

You have learnt some geometrical ideas in previous classes. Let us have fun trying some thing we have already done.

\section*{Exercise - 4.1}
1. Name the figures drawn below.

(i)

\({ }^{\circ} \mathrm{P}\)
(iv)
2. Draw the figures for the following.
(i) \(\overrightarrow{\mathrm{OP}}\)
(ii) Point X
(iii) \(\overleftrightarrow{\mathrm{RS}}\)
(iv) \(\overline{\mathrm{CD}}\)
3. Name all the possible line segments in the following figure.

4. Write any five examples of angles that you have observed arround.

Example: The angle formed when a scissor is opened.
5. Identify the following given angles as acute, right or obtuse.

(i)

(iii)

(ii)

(v)
6. Name all the possible angles you can find in the following figure. Which are acute, right, obtuse and straight angles?

7. Which of the following pairs of lines are parallel? Why?

(i)

(ii)

(iii)

(iv)
8. Which of the following lines are intersecting?

(i)

(ii)

(iii)

(iv)

\subsection*{4.1 Learning about Pairs of Angles}

We have learnt how to identify some angles in the previous chapter. Now we will learn about some more angles as well as various pairs of angles.

\subsection*{4.1.1 Complementary Angles}

When the sum of two angles is equal to \(90^{\circ}\), the angles are called complementary angles.

These are complementary angles, as their sum is \(30^{\circ}+60^{\circ}=90^{\circ}\).
We can also say that the complement of \(30^{\circ}\) is \(60^{\circ}\) and the complement of \(60^{\circ}\) is \(30^{\circ}\).

In the above figures, the sum of the two angles is \(70^{\circ}+40^{\circ} \neq 90^{\circ}\). Thus, these angles are not a pair of complementary angles.

\section*{Try This}

Draw any five pairs of complementary angles of your choice.

\section*{Do This}

Draw an angle \(\angle \mathrm{AOB}=40^{\circ}\). With the same vertex ' O ' draw \(\mathrm{C} \uparrow\) \(\angle \mathrm{BOC}=50^{\circ}\), taking \(\overrightarrow{\mathrm{OB}}\) as initial ray as shown in the figure.

Since the sum of these angles is \(90^{\circ}\), they together form a right angle. Take another pair \(60^{\circ}\) and \(50^{\circ}\) and join in the same way. Do they form complementary angles? Why?

\section*{Exercise - 4.2}
1. Which of the following pairs of angles are complementary?

2. Find the complementary angles of the following.
(i) \(25^{0}\)
(ii) \(40^{\circ}\)
(iii) \(89^{\circ}\)
(iv) \(55^{\circ}\)
3. Two angles are complement to each other and are also equal. Find them.
4. Manasa says, "Each angle in any pair of complementary angles is always acute". Do you agree? Give reasons.

\subsection*{4.1.2 Supplementary Angles}

When the sum of two angles are equal to \(180^{\circ}\), then the angles are called supplementary angles.

The above pair of angles are supplementary as their sum is \(180^{\circ}\) i.e. \(120^{\circ}+60^{\circ}=180^{\circ}\).
We say that the supplement of \(120^{\circ}\) is \(60^{\circ}\) and the supplement of \(60^{\circ}\) is \(120^{\circ}\).

\(130^{\circ}\) and \(100^{\circ}\) angles are not a pair of supplementary angles. Why?

\section*{Do This}

Draw an angle \(\angle \mathrm{AOB}=100^{\circ}\). With the same vertex O, draw \(\angle \mathrm{BOC}=80^{\circ}\) such that \(\overrightarrow{\mathrm{OB}}\) is common to two angles.

You will observe that the above angles form a straight angle i.e. \(180^{\circ}\).
Thus, the angles \(100^{\circ}\) and \(80^{\circ}\) are supplementary to each other.
Are \(130^{\circ}\) and \(70^{\circ}\) supplementary angles? Why?

\section*{Try This}

Write any five pairs of supplementary angles of your choice.

\section*{Exercise - 4.3}
1. Which of the following pairs of angles are supplementary?

(i)

(ii)

(iii)
2. Find the supplementary angles of the given angles.
(i) \(105^{\circ}\)
(ii) \(95^{0}\)
(iii) \(150^{\circ}\)
(iv) \(20^{\circ}\)
3. Two acute angles cannot form a pair of supplementary angles. Justify.
4. Two angles are equal and supplementary to each other. Find them.

\subsection*{4.1.3 Adjacent Angles}

The angles having a common arm and a common 'vertex' are called as adjacent angles.

The angles \(\angle \mathrm{AOB}\) and \(\angle \mathrm{BOC}\) in Figure (i) are adjacent angles, as they have a common vertex ' O ' and common arm \(\overrightarrow{\mathrm{OB}}\).

Are the angles in Figure (ii) adjacent angles? If yes, which is the common vertex and which is the common arm?

Now, look at figure (iii).

Are \(\angle \mathrm{QOP}\) and \(\angle \mathrm{SOR}\) adjacent angles. Why?
Which angles are adjacent to each other in the above figure?
Why do you think they are adjacent angles?

\section*{Exercise - 4.4}
1. Which of the following are adjacent angles?

(i)

(ii)

(iii)
2. Name all pairs of adjacent angles in the figure. How many pairs of adjacent angles are formed? Why these angles are called adjacent angles?

3. Can two adjacent angles be supplementary? Draw figure.
4. Can two adjacent angles be complementary? Draw figure.
5. Give four examples of adjacent angles in daily life.

Example : Angles between the spokes at the centre of a cycle wheel.
(i)
\(\qquad\)
(ii) \(\qquad\)
(iii) \(\qquad\) (iv) \(\qquad\)

\subsection*{4.1.3 (a) Linear Pair}

(i)

(ii)

Look at Figure (i). \(\angle \mathrm{COA}\) and \(\angle \mathrm{BOC}\) are adjacent angles. What is the sum of these angles?
These angles together form a straight angle. Similarly, look at Figure (ii). Do \(\angle \mathrm{POQ}\) and \(\angle \mathrm{QOR}\) together form a straight angle?

A pair of adjacent angles whose sum is a straight angle \(\left(180^{\circ}\right)\) is called a Linear Pair.

\section*{Do This}

Two adjacent angles are \(40^{\circ}\) and \(140^{\circ}\). Do they from a linear pair?
Draw a picture and check. Renu drew the picture like this.

Has she drawn correctly? Do these adjacent angles form a linear pair?

\section*{Exercise - 4.5}
1. Draw the following pairs of angles as adjacent angles. Check whether they form linear pair.

2. Niharika took two angles \(130^{\circ}\) and \(50^{\circ}\) and tried to check whether they form a linear pair. She made the following picture.

Can we say that these two angles form a linear pair? If not, what is Niharika's mistake?

\subsection*{4.1.4 Vertically Opposite Angles}

When two lines intersect, the angles that are formed opposite to each other at the point of intersection (vertex) are called vertically opposite angles.

In above figure two lines ' \(l\) ' and ' \(m\) ' intersect each other at ' \(O\) '. Angle \(\angle 1\) is opposite to angle \(\angle 3\) and the other pair of opposite angles is \(\angle 2\) and \(\angle 4\). Thus, \(\angle 1, \angle 3\) and \(\angle 2, \angle 4\) are the two pairs of vertically opposite angles.

From the adjacent figure, identify the pairs of vertically opposite angles.

\section*{Do This}

Draw two lines \(\overrightarrow{\mathrm{AB}}\) and \(\overrightarrow{\mathrm{CD}}\) such that they intersect at point ' O '.
Trace the figure given below on a tracing paper. Place the traced figure over the figure given below and rotate it such that \(\angle \mathrm{DOB}\) coincides \(\angle \mathrm{COA}\).
Observe the angles \(\angle \mathrm{AOD}\) and \(\angle \mathrm{BOC}\) also \(\angle \mathrm{COA}\) and \(\angle \mathrm{DOB}\).
You will notice that \(\angle \mathrm{AOD}=\angle \mathrm{BOC}\) and \(\angle \mathrm{COA}=\angle \mathrm{DOB}\).

We can conclude that vertically opposite angles are equal.
Note : Take two straws. Fix them at a point 'O' with a pin. Place them such that the straw on top covers the one below. Rotate one of the straws. You will find that they make vertically opposite angles.

Exercise - 4.6
1. Name two pairs of vertically opposite angles in the figure.

2. Find the measure of \(x, y\) and \(z\) without actually measuring them.

3. Give some examples of vertically opposite angles in your surroundings.

\subsection*{4.2 Transversal}

You might have seen railway track. The following is the example for transversal lines.

A line which intersects two or more lines at distinct points is called a transversal.

Figure (i)

Figure (ii)

Figure (iii)

In Fig (i) two lines ' \(l\) ' and ' \(m\) ' are intersected by a line ' \(n\) ', at two distinct points.
Therefore, ' \(n\) ' is a transversal to ' \(l\) ' and m".
In Fig (ii) three lines ' \(p\) ', ' \(q\) ' and ' \(r\) ' are intersected by a line ' \(s\) ', at three distinct points.
So, ' \(s\) ' is a transversal to ' \(p\) ' ' \(q\) ' and ' \(r\) '.
InFig (iii) two lines ' \(a\) ' and ' \(b\) ' are intersected by a line ' \(c\) '. The point of intersection of ' \(c\) ' is the same as that of ' \(a\) ' and ' \(b\) '. The three lines are thus intersecting lines and none of them is a transversal to the other as no line intersects other two lines at distinct points.

\subsection*{4.2.1 Angles made by a transversal}

When a transversal cuts two lines, 8 angles are formed. This is because at each intersection 4 angles are formed. Observe the figure.

Here ' \(l\) ' and ' \(m\) ' are two lines intersected by the transversal ' \(p\) '. Eight angles \(\angle 1, \angle 2, \angle 3, \angle 4, \angle 5, \angle 6, \angle 7\) and \(\angle 8\) are formed.

Angles \(\angle 3, \angle 4, \angle 5\) and \(\angle 6\), are lying inside ' \(l\) ' and ' \(m\) '. They are thus called interior angles. The angles \(\angle 1, \angle 2, \angle 7\) and \(\angle 8\) are on the outside of the lines ' \(l\) ' and ' \(m\) '. They are thus called exterior angles.

Look at adjacent figure.
\(\angle 1, \angle 2, \angle 7\) and \(\angle 8\) are exterior angles.
\(\angle 3, \angle 4, \angle 5\) and \(\angle 6\) are interior angles.

We have learnt about vertically opposite angles and noted the fact that they are equal.
Renu looked at figure for vertically opposite angles, and said \(\angle 1=\angle 3\) and \(\angle 2=\angle 4\).
Which are the other two pairs of vertically opposite angles?
She said that each exterior angle is paired with an vertically opposite angle which is in the interior. The angles in these pairs are equal. Do you agree with Renu?

\section*{Do This}
1. Identify the transversal in Figure (i) and (ii).

Identify the exterior and interior angles and fill the table given below:

Figure (i)

Figure (ii)
\begin{tabular}{|c|c|r|c|}
\hline Figure & Transversal & Exterior angles & Interior angles \\
\hline (i) & & & \\
\hline (ii) & & & \\
\hline
\end{tabular}
2. Consider the following lines. Which line is a transversal? Find the number of angles formed and list them. Which are the exterior angles and which are the interior angles?

\subsection*{4.2.1 (a) Corresponding Angles}

Look at figures (i), (ii), (iii) and (iv) below-

(i)

(ii)

(iii)

(iv)

Consider the pairs of angles \((\angle 1, \angle 5),(\angle 2, \angle 6),(\angle 4, \angle 8),(\angle 3, \angle 7)\). Is there something common among these pairs of angles? These angles lie on different vertices. They are on the same side of the transversal and in each pair one is an interior angle and the other is an exterior angle. Thus, each of the above pair of angles are called corresponding angles.

What happens when a line is transversal to three lines? Which are the corresponding angles in this case? What is the number of exterior and interior angles in this case?

What would happen if number of lines intersected by the transversal becomes 4,5 and more?
Can you predict the number of exterior and the interior angles that are corresponding to each other?

\subsection*{4.2.1 (b) Interior and Exterior Alternate Angles}

Look at the adjacent figure. Find the angles which have the following three properties:
(i) Have different vertices.
(ii) Are on the either side of the transversal
(iii) Lie 'between' the two lines (i.e. are interior angles).

Such pairs of angles are called interior alternate angles.

The pairs of angles \((\angle 3, \angle 5)\) and \((\angle 4, \angle 6)\) are the two pairs of interior alternate angles. Similarly, you may find two pairs of exterior alternate angles.

The pairs of angles \((\angle 2, \angle 8)\) and \((\angle 1, \angle 7)\) are called alternate exterior angles.

\subsection*{4.2.1 (c) Interior Angles on the same side of the transversal}

Interior angles can be on the same side of the transversal too.

Angles ( \(\angle 4, \angle 5\) ) and ( \(\angle 3, \angle 6\) ) are the two pairs of interior angles on the same side of the transversal.
1. Name the pairs of angles in each figure by their property.

\subsection*{4.2.2 Transversal on parallel lines}

You know that two coplanar lines which do not intersect are called parallel lines.
Let us look at transversals on parallel lines and the properties of angles on them.
Look at the pictures.

These give examples for parallel lines with a transversal.

\section*{Do This}

Take a ruled sheet of paper. Draw two lines ' \(l\) ' and ' \(m\) ' parallel to each other and draw a transversal ' \(p\) ' on these lines.
Label the pairs of corresponding angles as shown in Figures (i), (ii), (iii) and (iv).

Figure (i)

Figure (iii)

Figure (ii)

Figure (iv)

Place the tracing paper over Figure (i). Trace the lines ' \(l\) ', ' \(m\) ' and ' \(p\) '. Slide the tracing paper along ' \(p\) ', until the line ' \(l\) ' coincides with line ' \(m\) '. You find that \(\angle 1\) on the traced figure coincides with \(\angle 2\) of the original figure. Thus \(\angle 1=\angle 2\)

Are the remaining pairs of corrosponding angles equal? Check by tracing and sliding.

You will find that if a pair of parallel lines are intersected by a transversal then the angles in each pair of corresponding angles are equal.

We can use this 'corresponding angles' property to get another result.
In the adjacent figure ' \(l\) ' and ' \(m\) ' are a pair of parallel lines and ' \(p\) ' is a transversal.
As all pairs of corresponding angles are equal,
\(\angle 1=\angle 5\)
But \(\angle 1=\angle 3\) (vertically opposite angles)
Thus, \(\angle 3=\angle 5\)
Similarly, you can show that \(\angle 4=\angle 6\).
Therefore, if a pair of parallel lines are intersected by a transversal then the angles in each pair of alternate interior angles are equal.

Do you find the same result for exterior alternate angles? Try.
Now, we find one more interesting result about interior angles on the same side of the transversal.

\(\angle 3=\angle 5\) ( alternate interior angles)

In the adjacent figure ' \(l\) ' and ' \(m\) ' a pair of parallel lines intersected by a transversal ' \(p\) '.

But \(\angle 3+\angle 4=180^{\circ}\) (Why?)
Thus, \(\angle 4+\angle 5=180^{\circ}\)
Similarly \(\angle 3+\angle 6=180^{\circ}\) (Give reason)
Thus, if a pair of parallel lines are intersected by a transversal then the angles in each pair of interior angles on the same side of the transversal are supplementary.

Example 1: In the adjacent figure, ' \(l\) ' and ' \(m\) ' are a pair of parallel lines.

\[
\text { ' } p \text { ' is a transversal. Find ' } x \text { '. }
\]

Solution: Given \(l \| m\), p is a transversal.
\(\angle x\) and \(20^{\circ}\) are a pair of exterior alternate angles, therefore they are equal.
Thus, \(\angle x=20^{\circ}\).

\section*{Do This}

Figure (i)

Figure (ii)

Trace the copy of figures (i) and (ii) in your note book. Measure the angles using a protractor and fill the following tables.

Table 1 : Fill the table with the measures of the corresponding angles.
\begin{tabular}{|l|l|l|l|l|}
\hline Figure & \multicolumn{4}{|c|}{ Pairs of corresponding angles } \\
\hline & \(1^{\text {st }}\) pair & \(2^{\text {nd }}\) pair & \(3^{\text {rd }}\) pair & \(4^{\text {th }}\) pair \\
\hline (i) & \(\angle 1=\ldots \ldots \ldots\). & \(\angle 2=\ldots \ldots \ldots\). & \(\angle 3=\ldots \ldots \ldots\). & \(\angle 4=\ldots \ldots \ldots\) \\
\hline & \(\angle 5=\ldots \ldots \ldots\). & \(\angle 6=\ldots \ldots \ldots\) & \(\angle 7=\ldots \ldots \ldots\). & \(\angle 8=\ldots \ldots \ldots\). \\
\hline (ii) & \(\angle 1=\ldots \ldots \ldots\). & \(\angle 2=\ldots \ldots .\). & \(\angle 3=\ldots \ldots \ldots\). & \(\angle 4=\ldots \ldots \ldots\) \\
\hline & \(\angle 5=\ldots \ldots \ldots\) & \(\angle 6=\ldots \ldots \ldots\) & \(\angle 7=\ldots \ldots \ldots\) & \(\angle 8=\ldots \ldots \ldots\). \\
\hline
\end{tabular}

Find out in which figure the pairs of corresponding angles are equal.
What can you say about the lines ' \(l\) ' and ' \(m\) '?
What can you say about the lines ' \(p\) ' and ' \(q\) ' ?
Which pair of lines are parallel?

\section*{Thus, when a transversal intersects two lines and the pair of corresponding angles are equal then the lines are parallel.}

Table 2 : Fill the table with the measures of the interior alternate angles.
\begin{tabular}{|l|l|l|}
\hline Figure & \multicolumn{2}{|c|}{ Pairs of interior alternate angles } \\
\hline & \(1^{\text {st }}\) pair & \(2^{\text {nd }}\) pair \\
\hline (i) & \(\angle 3=\ldots \ldots \ldots\). & \(\angle 4=\ldots \ldots .\). \\
& \(\angle 5=\ldots \ldots \ldots\) & \(\angle 6=\ldots \ldots .\). \\
\hline (ii) & \(\angle 3=\ldots \ldots \ldots\) & \(\angle 4=\ldots \ldots .\). \\
& \(\angle 5=\ldots \ldots .\). & \(\angle 6=\ldots \ldots .\). \\
\hline
\end{tabular}

Find out in which figure the pairs of interior alternate angles are equal?
What can you say about the lines ' \(l\) ' and ' \(m\) '?
What can you say about the lines ' \(p\) ' and ' \(q\) '?

\section*{Thus, if a pair of lines are intersected by a transversal and the alternate interior angles are equal then the lines are parallel.}

Table 3 : Fill the table with the measures of interior angles on the same side of the transversal
\begin{tabular}{|l|l|l|l|l|}
\hline Figure & \multicolumn{3}{|c|}{ Pairs of interior angles on the same side of the transversal. } \\
\hline & \multicolumn{2}{|c|}{\(1^{\text {st }}\) pair } & \multicolumn{2}{|c|}{\(2^{\text {nd }}\) pair } \\
\hline (i) & \(\angle 3=\ldots \ldots \ldots\). & \(\angle 3+\angle 6=\ldots \ldots \ldots\). & \(\angle 4=\ldots \ldots \ldots\). & \(\angle 4+\angle 5=\ldots \ldots \ldots\). \\
& \(\angle 6=\ldots \ldots \ldots\). & & \(\angle 5=\ldots \ldots .\). & \\
\hline (ii) & \(\angle 3=\ldots \ldots \ldots\). & \(\angle 3+\angle 6=\ldots \ldots .\). & \(\angle 4=\ldots \ldots .\). & \(\angle 4+\angle 5=\ldots \ldots \ldots\). \\
& \(\angle 6=\ldots \ldots .\). & & \(\angle 5=\ldots \ldots .\). & \\
\hline
\end{tabular}

In which figure the pairs of interior angles on the same side of the transversal are supplementary (i.e. sum is \(180^{\circ}\) )?

What can you say about the lines ' \(l\) ' and ' \(m\) '?
What can you say about the lines ' \(p\) ' and ' \(q\) '?

\section*{Thus, if a pair of lines are intersected by a transversal and the interior angles on the same side of the transversal are supplementary then the lines are parallel.}

Example 2: In the figure given below, two angles are marked as \(30^{\circ}\) each.
Is \(\mathrm{AB} \| \mathrm{CD}\) ? How?

Solution: The given angles form a pair of interior alternate angles with transversal \(\overline{\mathrm{BC}}\) and therefore, \(\overline{\mathrm{AB}} \| \overline{\mathrm{CD}}\).

\section*{Exercise - 4.7}
1. Fill up the blanks-
(i) The line which intersects two or more lines at distinct points is called \(\qquad\)
(ii) If the pair of alternate interior angles are equal then the lines are \(\qquad\)
(iii) The sum of interior angles on the same side of the transversal are supplementary then the lines are \(\qquad\)
(iv) If two lines intersect each other then the number of common points they have
\(\qquad\) .
2. In the adjacent figure, the lines ' \(l\) ' and ' \(m\) ' are parallel and ' \(n\) ' is a transversal.

Fill in the blanks for all the situations given below-
(i) If \(\angle 1=80^{\circ}\) then \(\angle 2=\) \(\qquad\)
(ii)

If \(\angle 3=45^{\circ}\)
then
\(\angle 7=\) \(\qquad\)
(iii) If \(\angle 2=90^{\circ}\) then \(\angle 8=\) \(\qquad\)
(iv) If \(\angle 4=100^{\circ}\) then \(\angle 8=\) \(\qquad\)
3. Find the measures of \(\mathrm{x}, \mathrm{y}\) and z in the figure, where \(l \mathrm{ll} \mathrm{BC}\)

4. ABCD is a quadrilateral in which \(\mathrm{AB} \| \mathrm{DC}\) and \(\mathrm{AD} \| \mathrm{BC}\). Find \(\angle \mathrm{b}, \angle \mathrm{c}\) and \(\angle \mathrm{d}\).

5. In a given figure, ' \(l\) ' and ' \(m\) ' are intersected by a transversal ' \(n\) '. Is \(l \| m\) ?

6. Find \(\angle \mathrm{a}, \angle \mathrm{b}, \angle \mathrm{c}, \angle \mathrm{d}\) and \(\angle \mathrm{e}\) in the figure? Give reasons.

(Note: Two arrow marks pointing in the same direction represent parallel lines.)

\section*{Looking Back}
1.(i) If the sum of two angles is equal to \(90^{\circ}\), then the angles are called complementary angles.
(ii)Each angle in a pair of complementary angles is acute.
2. (i) If the sum of two angles is equal to \(180^{\circ}\), then the angles are called
 supplementary angles.
(ii) Each angle in a pair of supplementary angles may be either acute or right or obtuse.
(iii) Two right angles always supplement to each other.
3. The angles formed on both sides of a common arm and a common vertex are adjacent angles.
4. A pair of complementary angles or a pair of supplementary angles need not be adjacent angles.
5. A pair of angles that are adjacent and supplementary form a linear pair.
6. (i) When two lines intersect each other at a point (vertex), the angles formed opposite to each other are called vertically opposite angles.
(ii) A pair of vertically opposite angles are always equal in measure
7. (i) A line which intersects two or more lines at distinct points is called a transversal to the lines.
(ii) A transversal makes eight angles with two lines as shown
 in the adjacent figure.
\begin{tabular}{|c|l|l|l|}
\hline S.No. & \multicolumn{1}{|c|}{ Types of angles } & \begin{tabular}{c} 
No.of \\
Pairs
\end{tabular} & \multicolumn{1}{|c|}{ Angles } \\
\hline 1. & Interior angles & - & \(\angle 3, \angle 4, \angle 5, \angle 6\) \\
\hline 2. & Exterior angles & - & \(\angle 1, \angle 2, \angle 7, \angle 8\) \\
\hline 3. & Vertically opposite angles & 4 pairs & \((\angle 1, \angle 3) ;(\angle 4, \angle 2) ;(\angle 5, \angle 7) ;(\angle 8, \angle 6)\) \\
\hline 4. & Corresponding angles & 4 pairs & \((\angle 1, \angle 5) ;(\angle 2, \angle 6) ;(\angle 4, \angle 8) ;(\angle 3, \angle 7)\) \\
\hline 5. & Alternate interior angles & 2 pairs & \((\angle 3, \angle 5) ;(\angle 4, \angle 6)\) \\
\hline 6. & Alternate exterior angles & 2 pairs & \((\angle 1, \angle 7) ;(\angle 2, \angle 8)\) \\
\hline 7. & \begin{tabular}{l} 
Interior angles on the \\
same side of transversal
\end{tabular} & 2 pairs & \((\angle 3, \angle 6) ;(\angle 4, \angle 5)\) \\
\hline 8. & & \\
\hline
\end{tabular}
8. When a transversal intersects a pair of parallel lines, the angles in
(i) Each pair of corresponding angles are equal.
(ii) Each pair of alternate interior angles are equal.
(iii) Each pair of alternate exterior angles are equal.
(iv) Each pair of interior angles on the same side of the transversal are supplementary.

\subsection*{5.0 Introduction}

You have learnt about triangles in your previous class. Look at the figures given below. Which of these are triangles?

(i)

(ii)

(iii)

(iv)

Discuss with your friends why only some of these figures are triangles.
We know that a triangle is a closed figure made up of three line segments.
Obser \(\triangle P Q R\) in the adjacent figure. It has
(i) Three sides which are \(\overline{\mathrm{PQ}}, \overline{\mathrm{QR}}, \overline{\mathrm{RP}}\)
(ii) Three angles which are \(\angle \mathrm{RQP}, \angle \mathrm{QPR}, \angle \mathrm{PRQ}\)

(iii) Three vertices which are \(\mathrm{P}, \mathrm{Q}, \mathrm{R}\)

The side opposite to vertex P is \(\overline{\mathrm{QR}}\). Can you name the sides which are opposite to vertices Q and R ?

Likewise, the side opposite to \(\angle \mathrm{QPR}\) is \(\overline{\mathrm{QR}}\). Can you name the side which is opposite to \(\angle \mathrm{RQP}\) ?

\section*{Try This}

Uma felt that a triangle can be formed with three collinear points. Do you agree? Why?
Draw diagram to justify your answer.
Note: If three or more points lie on the same line, then they are called collinear points.

Note: \(\mathrm{LM}=\) Length of Line segment of \(\mathrm{LM} ; \quad \overline{\mathrm{LM}}=\) Line segment LM
\[
\overrightarrow{\mathrm{LM}}=\text { Ray LM } \quad ; \quad \overrightarrow{\mathrm{LM}}=\text { Line LM }
\]

\subsection*{5.1 Classification of triangles}

Triangles can be classified based on their sides and angles.
Based on the sides, triangles are classified into three types:
- A triangle having all three sides of equal length is called an Equilateral Triangle.
- A triangle having two sides of equal length is called an Isosceles Triangle.
- If all the three sides of a triangle are of different length, the triangle is called a Scalene Triangle.

Based on the angles, triangles are again classified into three types:
- A triangle whose all angles are acute is called an acute-angled triangle.
- A triangle whose any one of angles is obtuse is called an obtuse-angled triangle.
- A triangle whose any one of angles is a right angle is called a right-angled triangle.

\section*{Do This}
1. Classify the following triangles according to their (i) sides and (ii) angles.

(2) Write the six elements (i.e. the 3 sides and 3 angles) of \(\triangle \mathrm{ABC}\).
(3) Write the side opposite to vertex Q in \(\triangle \mathrm{PQR}\).
(4) Write the angle opposite to side \(\overline{\mathrm{LM}}\) in \(\triangle \mathrm{LMN}\).
(5) Write the vertex opposite to side \(\overline{\mathrm{RT}}\) in \(\Delta \mathrm{RST}\).

If we consider triangles in terms of both sides and angles we can have the following types of triangles:
\begin{tabular}{|c|c|c|c|}
\hline Type of Triangle & Equilaterial & Isosceles & Scalene \\
\hline Acute-angled & & & \\
\hline Right-angled & & & \\
\hline Obtuse-angled & & \\
\hline
\end{tabular}

\section*{Try This}
1. Make paper-cut models of the various types of triangles discussed above. Compare your models with those of your friends.
2. Rashmi claims that no triangle can have more than one right angle. Do you agree with her. Why?
3. Kamal claims that no triangle can have more than two acute angles. Do you agree with him. Why?

\subsection*{5.2 Relationship between the sides of a triangle}

\subsection*{5.2.1 Sum of the lengths of two sides of a triangle}

Draw any three triangles say \(\triangle \mathrm{ABC}, \triangle \mathrm{PQR}\) and \(\triangle \mathrm{XYZ}\) as given below:

Use your ruler to find the lengths of their sides and tabulate your results as follows:
\begin{tabular}{|c|c|c|c|c|}
\hline Name of \(\Delta\) & Length of sides & Sumoflengths of two sides & Is this true? & Yes/No \\
\hline \(\triangle \mathrm{ABC}\) & \(\mathrm{CA}=\) & \(A B+B C=\) & \(\mathrm{AB}+\mathrm{BC}>\mathrm{CA}\) & \\
\hline \multirow[t]{2}{*}{} & \(\mathrm{AB}=\) & \(\mathrm{BC}+\mathrm{CA}=\) & \(\mathrm{BC}+\mathrm{CA}>\mathrm{AB}\) & \\
\hline & \(\mathrm{BC}=\) & \(C A+A B\) & \(\mathrm{CA}+\mathrm{AB}>\mathrm{BC}\) & \\
\hline \(\triangle \mathrm{PQR}\) & \(\mathrm{RP}=\) & \[
\mathrm{PQ}+\mathrm{QR}=
\] & \(\mathrm{PQ}+\mathrm{QR}>\mathrm{RP}\) & \\
\hline \multirow[t]{2}{*}{} & \(P \mathrm{Q}=\) & \(\mathrm{QR}+\mathrm{RP}=\) & \(\mathrm{QR}+\mathrm{RP}>\mathrm{PQ}\) & \\
\hline & \(\mathrm{QR}=\) & \(\mathrm{RP}+\mathrm{PQ}=\) & \(\mathrm{RP}+\mathrm{PQ}>\mathrm{QR}\) & \\
\hline \(\triangle \mathrm{XYZ}\) & ZX= & \(\mathrm{XY}+\mathrm{YZ}=\) & \(X Y+Y Z>Z X\) & \\
\hline \multirow[t]{2}{*}{} & \(X Y=\) & \(\mathrm{YZ}+\mathrm{ZX}=\) & \(\mathrm{YZ}+\mathrm{ZX}>\mathrm{XY}\) & \\
\hline & YZ & \(\mathrm{ZX}+\mathrm{XY}=\) & \(\mathrm{ZX}+\mathrm{XY}>\mathrm{YZ}\) & \\
\hline
\end{tabular}

We can see that in all the above examples, the sum of the lengths of any two sides of a triangle is greater than the length of the third side.

For eg. In \(\triangle \mathrm{ABC}, \quad \mathrm{AB}+\mathrm{BC}>\mathrm{CA}\)
\[
\begin{aligned}
& \mathrm{BC}+\mathrm{CA}>\mathrm{AB} \\
& \mathrm{CA}+\mathrm{AB}>\mathrm{BC}
\end{aligned}
\]

\subsection*{5.2.2 Difference between the lengths of two sides of a triangle}

Take the same triangles as in the above example and tabulate your results as follows:
\begin{tabular}{|l|l|l|l|l|}
\hline Name of \(\Delta\) & Length of sides & Difference between lengths oftwo sides & Is this true? & Yes/No \\
\hline \multirow{4}{*}{\(\Delta \mathrm{ABC}\)} & \(\mathrm{AB}=\) & \(\mathrm{BC}-\mathrm{CA}=\) & \(\mathrm{BC}-\mathrm{CA}<\mathrm{AB}\) & \\
\hline \multirow{4}{*}{\(\Delta \mathrm{PQR}\)} & \(\mathrm{BC}=\) & \(\mathrm{CA}-\mathrm{AB}=\) & \(\mathrm{CA}-\mathrm{AB}<\mathrm{BC}\) & \\
\cline { 2 - 5 } & \(\mathrm{CA}=\) & \(\mathrm{AB}-\mathrm{BC}=\) & \(\mathrm{AB}-\mathrm{BC}<\mathrm{CA}\) & \\
\hline \multirow{4}{*}{\begin{tabular}{ll|l|l|} 
& \(\mathrm{PQ}=\) & \(\mathrm{QR}-\mathrm{RP}=\) & \(\mathrm{QR}-\mathrm{RP}<\mathrm{PQ}\) \\
\hline
\end{tabular} \(\mathrm{QR}=\)} & \(\mathrm{RP}-\mathrm{PQ}=\) & \(\mathrm{RP}-\mathrm{PQ}<\mathrm{QR}\) & \\
\hline \multirow{3}{*}{\(\Delta \mathrm{XYZ}\)} & \(\mathrm{RP}=\) & \(\mathrm{PQ}-\mathrm{QR}=\) & \(\mathrm{PQ}-\mathrm{QR}<\mathrm{RP}\) & \\
\hline \multirow{4}{*}{} & \(\mathrm{YZ}=\) & \(\mathrm{YZ}-\mathrm{ZX}=\) & \(\mathrm{YZ}-\mathrm{ZX}<\mathrm{XY}\) & \\
\cline { 2 - 5 } & \(\mathrm{ZX}=\) & \(\mathrm{ZY}-\mathrm{XY}=\) & \(\mathrm{ZX}-\mathrm{XY}<\mathrm{YZ}\) & \\
\hline
\end{tabular}

From these observations we can conclude that the difference between the lengths of any two sides of a triangle is less than the length of the third side.

For eg. In \(\triangle \mathrm{ABC}\),
\[
\begin{array}{ll}
\mathrm{AB}-\mathrm{BC}<\mathrm{CA} ; & \mathrm{BC}-\mathrm{AB}<\mathrm{CA} \\
\mathrm{BC}-\mathrm{CA}<\mathrm{AB} ; & \mathrm{CA}-\mathrm{BC}<\mathrm{AB} \\
\mathrm{CA}-\mathrm{AB}<\mathrm{BC} ; & \mathrm{AB}-\mathrm{CA}<\mathrm{BC}
\end{array}
\]

\section*{Try This \\ The lengths of two sides of a triangle are 6 cm and 9 cm . Write all the possible lengths of the third side.}

Example 1: Can a triangle have sides with lengths \(6 \mathrm{~cm}, 5 \mathrm{~cm}\) and 8 cm ?
Solution: Let the sides of the triangle be \(\mathrm{AB}=6 \mathrm{~cm}\)
\[
\begin{aligned}
\mathrm{BC} & =5 \mathrm{~cm} \\
\mathrm{CA} & =8 \mathrm{~cm}
\end{aligned}
\]

Sum of any two sides i.e, \(\mathrm{AB}+\mathrm{BC}=6+5=11>8\)
\[
\begin{aligned}
\mathrm{BC}+\mathrm{CA} & =5+8=13>6 \\
\mathrm{CA}+\mathrm{AB} & =8+6=14>5
\end{aligned}
\]

Since, the sum of the lengths of any two sides is greater than the length of the third side. So, the triangle can be constructed using the above given measurements.

\section*{Exercise - 5.1}
1. Is it possible to have a triangle with the following sides?
(i) \(3 \mathrm{~cm}, 4 \mathrm{~cm}\) and 5 cm .
(ii) \(6 \mathrm{~cm}, 6 \mathrm{~cm}\) and 6 cm .
(iii) \(4 \mathrm{~cm}, 4 \mathrm{~cm}\) and 8 cm .
(iv) \(3 \mathrm{~cm}, 5 \mathrm{~cm}\) and 7 cm .

\subsection*{5.3 Altitudes of a triangle}

In your daily life you might have come across the word 'height' in different situations. How will you measure the height of different figures given below?

You will measure it from the top point of the object to its base as shown in the figures. Let us use this creteria to measure the height for a triangle.

In a given \(\triangle \mathrm{ABC}\), the height is the distance from vertex A to the
 base \(\overline{\mathrm{BC}}\). However, you can think of many line segments from A to \(\overline{\mathrm{BC}}\). Which among them will represent the height?
The height is given by length of the line segment that starts from \(A\) and is perpendicular to \(\overline{\mathrm{BC}}\). Thus, the line segment \(\overline{\mathrm{AD}}\) is the altitude of the triangle and its length is height. An altitude can be drawn from each vertex.

\section*{Try This}
1. (i) Draw altitudes from P to \(\overline{\mathrm{QR}}\) for the following triangles. Also, draw altitudes from the other two vertices.(you can use set squares if needed)

Obtuse-angled

Right-angled

Acute-angled
(ii) Will an altitude always lie in the interior of a triangle?
(iii) Can you think of a triangle in which the two altitudes of a triangle are two of its sides?

\subsection*{5.4 Medians of a triangle}

Make a paper cut out of \(\triangle \mathrm{ABC}\).
Now fold the triangle in such a way that the vertex B falls on vertex C . The line along which the triangle has been folded will
 intersect side \(\overline{\mathrm{BC}}\) as shown in Figure 1. The point of intersection is the mid-point of side \(\overline{\mathrm{BC}}\) which we call D. Join vertex A and this mid-point D (as can be seen in Figure 2).

Figure 1

Figure 2

Similarly, fold the triangle in such a way that the vertex Afalls on vertex C. The line along which the triangle has been folded will intersect side \(\overline{\mathrm{AC}}\). The point of intersection is the mid-point of side \(\overline{\mathrm{AC}}\) which is marked as E . Join vertex B and this mid-point E .
Lastly, fold the triangle in such a way that the vertex A falls on vertex \(B\). The line along which the triangle has been folded will intersect side \(\overline{\mathrm{AB}}\). The point of intersection of F is the mid-point of side \(A B\). Join vertex \(C\) and this mid-point \(F\).
\(\mathrm{AD}, \mathrm{BE}\) and CF are the line segments formed by joining the vertices \(A, B\) and \(C\) of the triangle to the mid-points of the opposite sides. They are called the medians of the triangle.

You will observe that the three medians intersect each other at a
 point in the interior of the triangle. This point of concurrency is called the Centroid (G).

Thus, line segments which join the vertex of the triangle to the mid-point of the opposite side are called medians of the triangle. This point of concurrency of medians is called the Centroid (G).

\section*{\(Q_{1}\) Try This}

Take paper cut outs of right-angled triangles and obtuse-angled triangles and find their centroid.

\section*{Exercise - 5.2}
1. In \(\triangle \mathrm{ABC}, \mathrm{D}\) is the midpoint of BC
(i) AD is the \(\qquad\)
(ii) AE is the \(\qquad\)

2. Name the triangle in which the two altitudes of the triangle are two of its sides.
3. Does a median always lie in the interior of the triangle?
4. Does an altitude always lie in the interior of a triangle?
5. (i) Write the side opposite to vertex \(Y\) in \(\triangle X Y Z\).
(ii) Write the angle opposite to side \(\overline{\mathrm{PQ}}\) in \(\triangle \mathrm{PQR}\).
(iii) Write the vertex opposite to side \(\overline{\mathrm{AC}}\) in \(\triangle \mathrm{ABC}\).

\subsection*{5.5 Properties of triangles}

\subsection*{5.5.1 Angle-sum property of a triangle}

Let us learn about this property through the following four activities

\section*{Activity 1}
1. On a white sheet of paper, draw a triangle ABC . Using colour pencils mark its angles as shown.
2. Using scissors, cut out the three angular regions.
3. Draw a line XY and mark a point ' \(O\) ' on it.

4. Paste the three angular cut outs adjacent to each other to form one angle at ' O ' as shown in the figure below.

You will find that three angles now constitute a straight angle. Thus, the sum of the measures of angles of a triangle is equal to \(180^{\circ}\).

Activity 2
Take a piece of paper and cut out a triangle, say \(A B C\). Draw the altitude \(A M\) by folding \(\triangle A B C\). Now, fold the three corners such that all the vertices A, B and C touch at M as shown in the following figures.

(i)

(ii)

(iii)

You will see that all the three angles \(\mathrm{A}, \mathrm{B}\) and C form a straight line and thus \(\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}=180^{\circ}\).

\section*{Activity 3}

Take three copies of any triangle, say ABC. Mark its angles as 1,2 and 3 as shown below:

Arrange these triangular cut-outs as shown in the following figures.

What do you observe about \(\angle 1+\angle 2+\angle 3\) at the point ' O '?
You will observe that three angles form a straight line and so measure \(180^{\circ}\).

\section*{Activity 4}

Draw any three triangles, say \(\triangle \mathrm{ABC}, \triangle \mathrm{PQR}\) and \(\triangle \mathrm{XYZ}\) in your note book. Use your protractor and measure each of the angles of these triangles.
\begin{tabular}{|c|c|l|}
\hline \begin{tabular}{c} 
Name of the \\
Triangle
\end{tabular} & Measure of angles & Sum of the measures of the three angles \\
\hline\(\triangle \mathrm{ABC}\) & \(\angle \mathrm{A}=\ldots ., \angle \mathrm{B}=\ldots ., \angle \mathrm{C}=\ldots .\), & \(\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}=\) \\
\hline\(\Delta \mathrm{PQR}\) & \(\angle \mathrm{P}=\ldots \ldots, \angle \mathrm{Q}=\ldots ., \angle \mathrm{R}=\ldots .\), & \(\angle \mathrm{P}+\angle \mathrm{Q}+\angle \mathrm{R}=\) \\
\hline\(\Delta \mathrm{XYZ}\) & \(\angle \mathrm{X}=\ldots \ldots, \angle \mathrm{Y}=\ldots ., \angle \mathrm{Z}=\ldots \ldots\), & \(\angle \mathrm{X}+\angle \mathrm{Y}+\angle \mathrm{Z}=\) \\
\hline
\end{tabular}

Allowing marginal errors in measurements, you will find that the sum of the three angles of a triangle is \(180^{\circ}\).

Now, let us observe the proof- "the sum of the angles of a triangle is equal to \(180^{\circ}\) " through logical argumentation.

\section*{Proof of angle-sum property of a triangle:}

Statement : The sum of the three angles of a triangle is \(180^{\circ}\)
Given : A triangle ABC
To prove : \(\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}=180^{\circ}\)

Construction : Through Adraw a line segment PQ parallel to BC .

\section*{Proof:}

Mark the angles with the numbers as indicated in the figure:
\[
\begin{array}{rlrl}
\angle 2 & =\angle 5 & & \text { (alternate interior angles) } \\
\angle 3 & =\angle 4 & & \text { (alternate interior angles) } \\
\angle 2+\angle 3 & =\angle 5+\angle 4 & & \text { (adding above two equations) } \\
\angle 1+\angle 2+\angle 3 & =\angle 1+\angle 5+\angle 4 & & \text { (adding } \angle 1 \text { to both sides) } \\
\text { But } \angle 1+\angle 5+\angle 4 & =180^{\circ} & & \text { (angles forming a straight line) } \\
\therefore \quad & &
\end{array}
\]

Thus, the sum of the three angles of a triangle is \(180^{\circ}\).
Example 1: In \(\triangle \mathrm{ABC}, \angle \mathrm{A}=30^{\circ}, \angle \mathrm{B}=45^{\circ}\), find \(\angle \mathrm{C}\).
Solution: In \(\triangle \mathrm{ABC}, \angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}=180^{\circ} \quad\) (angle-sum property of a triangle)
\[
\begin{aligned}
30^{\circ}+45^{\circ}+\angle \mathrm{C} & =180^{\circ} \\
75^{\circ}+\angle \mathrm{C} & =180^{\circ} \\
\angle \mathrm{C} & =180^{\circ}-75^{\circ} \\
\therefore \quad \angle \mathrm{C} & =105^{\circ}
\end{aligned}
\]

Example 2: In \(\triangle \mathrm{ABC}\), if \(\angle \mathrm{A}=3 \angle \mathrm{~B}\) and \(\angle \mathrm{C}=2 \angle \mathrm{~B}\). Find all the three angles of \(\triangle \mathrm{ABC}\).
Solution: \(\quad \angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}=180^{\circ} \quad\) [angle-sum property of a triangle]
\(3 \angle \mathrm{~B}+\angle \mathrm{B}+2 \angle \mathrm{~B}=180^{\circ} \quad[\angle \mathrm{A}=3 \angle \mathrm{~B}, \angle \mathrm{C}=2 \angle \mathrm{~B}]\)
\[
6 \angle B=180^{\circ}
\]

Therefore, \(\quad \angle \mathrm{B}=30^{\circ}\)
Thus,
\[
\begin{aligned}
& \angle \mathrm{A}=3 \angle \mathrm{~B}=3 \times 30^{\circ}=90^{\circ} \\
& \angle \mathrm{C}=2 \angle \mathrm{~B}=2 \times 30^{\circ}=60^{\circ}
\end{aligned}
\]

Example 3: \(\triangle \mathrm{ABC}\) is right angled at \(\mathrm{C}, \mathrm{CD} \perp \mathrm{AB}\) and \(\angle \mathrm{A}=55^{\circ}\).
Find (i) \(\angle \mathrm{DCA}\) (ii) \(\angle \mathrm{BCD}\) (iii) \(\angle \mathrm{ABC}\)
Solution: In \(\triangle \mathrm{ACD}\),

\[
\begin{array}{ll}
\angle \mathrm{CAD}+\angle \mathrm{ADC}+\angle \mathrm{DCA} & =180^{\circ} \text { (angle-sum property of a triangle) } \\
55^{\circ}+90^{\circ}+\angle \mathrm{DCA} & =180^{\circ} \quad \text { (substituing values given in question) }
\end{array}
\]
\[
\begin{aligned}
145^{\circ}+\angle \mathrm{DCA} & =180^{\circ} \\
\angle \mathrm{DCA} & =180^{\circ}-145^{\circ}=35^{\circ}
\end{aligned}
\]

Therefore, \(\quad \angle \mathrm{DCA}=35^{\circ}\)
(ii) In \(\triangle \mathrm{ABC}\),
\[
\angle \mathrm{ACB}=90^{\circ}
\]

Therefore, \(\quad \angle \mathrm{DCA}+\angle \mathrm{BCD}=90^{\circ}(\) from the figure \(\angle \mathrm{ACB}=\angle \mathrm{DCA}+\angle \mathrm{BCD})\)
\[
\begin{aligned}
& 35^{\circ}+\angle \mathrm{BCD}=90^{\circ}\left(\text { from }(\mathrm{i}), \angle \mathrm{DCA}=35^{\circ}\right) \\
& \angle \mathrm{BCD}=90^{\circ}-35^{\circ}=55^{\circ}
\end{aligned}
\]
(iii) In \(\triangle \mathrm{ABC}\),
\[
\begin{array}{cl}
\angle \mathrm{ABC}+\angle \mathrm{BCA}+\angle \mathrm{CAB}=180^{\circ} & \text { (angle-sum property of a triangle) } \\
\angle \mathrm{ABC}+90^{\circ}+55^{\circ}=180^{\circ} & \text { (given) } \\
\angle \mathrm{ABC}+145^{\circ}=180^{\circ} & \\
\angle \mathrm{ABC}=180^{\circ}-145^{\circ}
\end{array}
\]

Therefore, \(\quad \angle \mathrm{ABC}=35^{\circ}\)
Example 4: The angles of a triangle are in the ratio \(2: 3: 4\). Find the angles.
Solution: \(\quad\) The given ratio between the angles of the triangle \(=2: 3: 4\)
Sum of the terms of the ratio \(=2+3+4=9\)
Sum of the angles of a triangle \(=180^{\circ}\)
\[
\text { Therefore, } \quad \begin{aligned}
1^{\text {st }} \text { angle } & =\frac{2}{9} \times 180^{\circ}=40^{\circ} \\
2^{\text {nd }} \text { angle } & =\frac{3}{9} \times 180^{\circ}=60^{\circ} \\
3^{\text {rd }} \text { angle } & =\frac{4}{9} \times 180^{\circ}=80^{\circ}
\end{aligned}
\]

Thus, the angles of the triangle are \(40^{\circ}, 60^{\circ}\) and \(80^{\circ}\).

Example 5: Find the value of angle ' \(x\) ' in the figure.
Solution: \(\quad \angle \mathrm{ECD}=\angle \mathrm{CBA}=73^{\circ}\)
(Since \(\mathrm{AB} \| \mathrm{CD}\) these two are alternate angles)
In \(\triangle E C D\),
\(\angle \mathrm{DEC}+\angle \mathrm{CDE}+\angle \mathrm{ECD}=180^{\circ}\)
(sum of angles in a triangle is \(180^{\circ}\) )
\[
\begin{aligned}
x^{\circ}+40^{\circ}+73^{\circ} & =180^{\circ} \quad \text { (substituing given values) } \\
x^{\circ}+113^{\circ} & =180^{\circ} \\
x^{\circ} & =180^{\circ}-113^{\circ} \\
x^{\circ} & =67^{\circ}
\end{aligned}
\]

Example 6: One angle of \(\triangle \mathrm{ABC}\) is \(40^{\circ}\) and the other two angles are equal. Find the measure (value) of each equal angle.

Solution: Let \(\angle \mathrm{C}=40^{\circ}\) and \(\angle \mathrm{A}=\angle \mathrm{B}=x^{\circ}\)

Example 7: In the figure, D and E are the points on sides AB and AC of \(\triangle \mathrm{ABC}\) such that \(\mathrm{DE} \| \mathrm{BC}\). If \(\angle \mathrm{B}=30^{\circ}\) and \(\angle \mathrm{A}=40^{\circ}\), find (i) \(x\) (ii) \(y\) (iii) \(z\)

Solution: (i) \(\angle \mathrm{EDA}=\angle \mathrm{CBA}\) (corresponding angles as \(\mathrm{DE} \| \mathrm{BC}\) )
Therefore, \(x^{\circ}=30^{\circ}\)
(ii) In \(\triangle \mathrm{ABC}\),

\[
\begin{aligned}
\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C} & =180^{\circ} \quad\left(\text { sum of angles in a triangle is } 180^{\circ}\right) \\
40^{\circ}+30^{\circ}+y^{\circ} & =180^{\circ} \quad \quad \text { (substituting given values) } \\
70^{\circ}+y^{\circ} & =180^{\circ} \\
\therefore y^{\circ} & =180^{\circ}-70^{\circ}=110^{\circ}
\end{aligned}
\]
(iii) \(\mathrm{y}^{\circ}=\mathrm{z}^{\circ}=110^{\circ}\) (corresponding angles since \(\mathrm{DE} \| \mathrm{BC}\) )
(OR)
In \(\triangle \mathrm{ADE}, \angle \mathrm{A}+\angle \mathrm{ADE}+\angle \mathrm{AED}=180^{\circ}\) (the sum of the three angles of a triangle is \(180^{\circ}\) )
\[
\begin{aligned}
30^{\circ}+40^{\circ}+z^{\circ} & =180^{\circ} \\
70^{\circ}+z^{\circ} & =180^{\circ} \\
z^{\circ} & =180^{\circ}-70^{\circ} \\
z^{\circ} & =110^{\circ}
\end{aligned}
\]

\section*{Exercise - 5.3}
1. Find the value of the unknown ' \(x\) ' in the following triangles.

(i)

(ii)

(iii)
2. Find the values of the unknowns ' \(x\) ' and ' \(y\) ' in the following diagrams.

(i)

(ii)

(iv)

(v)

(iii)

(vi)
3. Find the measure of the third angle of triangles whose two angles are given below:
(i) \(38^{\circ}, 102^{\circ}\)
(ii) \(116^{\circ}, 30^{\circ}\)
(iii) \(40^{\circ}, 80^{\circ}\)
4. In a right-angled triangle, one acute angle is \(30^{\circ}\). Find the other acute angle.
5. State true or false for each of the following statements.
(i) A triangle can have two right angles.
(ii) A triangle can have two acute angles.
(iii) A triangle can have two obtuse angles.
(iv) Each angle of a triangle can be less than \(60^{\circ}\).
6. The angles of a triangle are in the ratio \(1: 2: 3\). Find the angles.
7. In the figure, \(\mathrm{DE} \| \mathrm{BC}, \angle \mathrm{A}=30^{\circ}\) and \(\angle \mathrm{B}=50^{\circ}\). Find the values of \(x, y\) and \(z\).

8. In the figure, \(\angle \mathrm{ABD}=3 \angle \mathrm{DAB}\) and \(\angle \mathrm{CDB}=96^{\circ}\). Find \(\angle \mathrm{ABD}\).

9. In \(\triangle \mathrm{PQR} \angle \mathrm{P}=2 \angle \mathrm{Q}\) and \(2 \angle \mathrm{R}=3 \angle \mathrm{Q}\), calculate the angles of \(\triangle \mathrm{PQR}\).
10. If the angles of a triangle are in the ratio \(1: 4: 5\), find the angles.
11. The acute angles of a right triangle are in the ratio \(2: 3\). Find the angles of the triangle.
12. In the figure, \(\triangle \mathrm{PQR}\) is right angled at \(\mathrm{Q}, \overline{\mathrm{ML}} \| \overline{\mathrm{RQ}}\) and \(\angle \mathrm{LMR}=130^{\circ}\). Find \(\angle \mathrm{MPL}, \angle \mathrm{LMP}\) and \(\angle \mathrm{QRP}\).
13. In Figure ABCDE , find \(\angle 1+\angle 2+\angle 3+\angle 4+\angle 5\).

\subsection*{5.5.2 Exterior angle of a triangle}

Draw \(\triangle \mathrm{ABC}\) and produce one of its sides say BC to a point D as shown in the Figure 1. Observe the \(\angle \mathrm{ACD}\) formed at point C . This angle lies in the exterior of \(\triangle \mathrm{ABC}\). We call it the exterior angle of \(\triangle \mathrm{ABC}\) formed at vertex C .

Figure 1

Figure 2

From the above activity, we can say that an exterior angle of a triangle is equal to the sum of two interior opposite angles.

\section*{Do This}

Draw \(\triangle \mathrm{ABC}\) and form an exterior \(\angle \mathrm{ACD}\). Now take a protractor and measure \(\angle \mathrm{ACD}, \angle \mathrm{A}\) and \(\angle \mathrm{B}\).
Find \(\angle \mathrm{A}+\angle \mathrm{B}\) and compare it with the measure \(\angle \mathrm{ACD}\).
Do you observe that \(\angle \mathrm{ACD}\) is equal (or nearly equal) to \(\angle \mathrm{A}+\angle \mathrm{B}\) ?
A logical step- by- step argument can further confirm that the exterior angle of a triangle is equal to the sum of the interior opposite angles.

Statement : An exterior angle of triangle is equal to the sum of its interior opposite angles.
Given \(\quad \triangle \mathrm{ABC}\) with \(\angle \mathrm{ACD}\) as exterior angle
To prove \(: \angle \mathrm{ACD}=\angle \mathrm{A}+\angle \mathrm{B}\)
Construction : Through C draw CE parallel to BA
Justification :

\(\angle 1=\angle x(\mathrm{BA} \| \mathrm{CE}\) and AC is transversal therefore, alternate angles are equal)
\(\angle 2=\angle y(\mathrm{BA} \| \mathrm{CE}\) and BD is transversal therefore, corresponding angles are equal)
\(\angle 1+\angle 2=\angle x+\angle y\)
\(\angle \mathrm{ACD}=\angle 1+\angle 2\)
Therefore, \(\angle \mathrm{ACD}=\angle 1+\angle 2\) (from the figure \(\angle x+\angle y=\angle \mathrm{ACD}\) )

Thus, the exterior angle of a triangle is equal to the sum of the interior opposite angles. This property is called the exterior-angle property of a triangle.

Example 8: In the figure, find the values of \(x\) and \(y\).
Solution: \(\quad \angle \mathrm{DCA}=\angle \mathrm{CBA}+\angle \mathrm{BAC}\) (exterior angle property)
\[
\begin{aligned}
135^{\circ} & =65^{\circ}+\mathrm{x}^{\circ} \\
135^{\circ}-65^{\circ} & =\mathrm{x}^{\mathrm{o}} \\
\text { Therefore, } \mathrm{x}^{\mathrm{o}} & =70^{\circ}
\end{aligned}
\]
\[
\begin{aligned}
\angle \mathrm{CBA}+\angle \mathrm{ACB}+\angle \mathrm{BAC} & =180^{\circ} \quad \text { (angle-sum property of a triangle) } \\
65^{\circ}+\mathrm{y}^{\circ}+70^{\circ} & =180^{\circ} \\
135^{\circ}+\mathrm{y}^{\circ} & =180^{\circ} \\
\mathrm{y}^{\circ} & =180^{\circ}-135^{\circ} \\
\therefore \quad \mathrm{y}^{\circ} & =45^{\circ}
\end{aligned}
\]

Example 9: One of the exterior angles of a triangle is \(120^{\circ}\) and the interior opposite angles are in the ratio \(1: 5\). Find the angles of the triangle.

Solution: \(\angle \mathrm{DCA}=120^{\circ}\) (from the question)

\(\angle \mathrm{DCA}=\angle \mathrm{A}+\angle \mathrm{B}\) (exterior angle property)
\(\angle \mathrm{A}+\angle \mathrm{B}=120^{\circ}\)
\(\angle \mathrm{B}: \angle \mathrm{A}=1: 5\)
\[
\angle \mathrm{B}=\frac{1}{6} \times 120^{\circ}=20^{\circ}
\]
\[
\angle \mathrm{A}=\frac{5}{6} \times 120^{\circ}=100^{\circ}
\]
\[
\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}=180^{\circ} \quad \text { (angle-sum property of a triangle) }
\]
\[
100^{\circ}+20^{\circ}+\angle \mathrm{C}=180^{\circ}
\]

Therefore, \(\quad \angle \mathrm{C}=180^{\circ}-120^{\circ}=60^{\circ}\)
Example 10 : In the adjacent figure, find
(i) \(\angle \mathrm{SRP}\) (ii) \(\angle \mathrm{STP}\) (iii) \(\angle \mathrm{RTS}\) (iv) \(\angle \mathrm{PRQ}\)

Solution: (i) In \(\triangle \mathrm{PQR}, \angle \mathrm{PRS}\) is the exterior angle
 and \(\angle \mathrm{RQP}\) and \(\angle \mathrm{QPR}\) are the interior opposite angles.
\(\therefore \quad \angle \mathrm{PRS}=\angle \mathrm{RQP}+\angle \mathrm{QPR} \quad\) (exterior angle property)
\(\angle \mathrm{PRS}=50^{\circ}+35^{\circ}=85^{\circ}\)
(ii) In \(\triangle \mathrm{RST}, \angle \mathrm{PTS}\) is the exterior angle and \(\angle \mathrm{SRT}\) and \(\angle \mathrm{RST}\) are the interior opposite angles.

Therefore, \(\quad \angle \mathrm{PTS}=\angle \mathrm{SRT}+\angle \mathrm{TSR}\)
\[
\begin{array}{ll}
\angle \mathrm{PTS} & =85^{\circ}+45^{\circ} \quad\left(\angle \mathrm{SRT}=\angle \mathrm{PRS}=85^{\circ}\right) \\
\angle \mathrm{PTS}=130^{\circ}
\end{array}
\]
(iii) \(\operatorname{In} \triangle \mathrm{RST}\)
\[
\begin{gathered}
\angle \mathrm{RTS}+\angle \mathrm{TSR}+\angle \mathrm{SRT}=180^{\circ} \quad \text { (angle-sum property of a triangle) } \\
\angle \mathrm{RTS}+45^{\circ}+85^{\circ}=180^{\circ} \\
\angle \mathrm{RTS}+130^{\circ}=180^{\circ}
\end{gathered}
\]

Therefore, \(\angle \mathrm{RTS}=180^{\circ}-130^{\circ}=50^{\circ}\)
(iv) \(\angle \mathrm{PRQ}+\angle \mathrm{SRP}=180^{\circ} \quad\) (liner pair property)
\[
\begin{aligned}
& \angle \mathrm{PRQ}+85^{\circ}=180^{\circ} \\
& \angle \mathrm{PRQ}=180^{\circ}-85^{\circ} \\
& \angle \mathrm{PRQ}=95^{\circ}
\end{aligned}
\]

Example 11: Show that the sum of the exterior angles of \(\triangle \mathrm{ABC}\) is \(360^{\circ}\).
Solution : \(\quad \angle 2+\angle 4=180^{\circ}\) (linear pair)
\(\angle 3+\angle 5=180^{\circ}\) (linear pair)
\(\angle 6+\angle 1=180^{\circ}\) (linear pair)
Adding the angles on both sides, we get-

\(\angle 2+\angle 4+\angle 3+\angle 5+\angle 6+\angle 1=180^{\circ}+180^{\circ}+180^{\circ}\)
\((\angle 4+\angle 5+\angle 6)+(\angle 1+\angle 2+\angle 3)=540^{\circ}\)
We know that, \(\angle 4+\angle 5+\angle 6=180^{\circ}\) (angle-sumproperty of a triangle)
Therefore, \(\quad 180^{\circ}+\angle 1+\angle 2+\angle 3=540^{\circ}\)
\[
\begin{aligned}
& \angle 1+\angle 2+\angle 3=540^{\circ}-180^{\circ} \\
& \angle 1+\angle 2+\angle 3=360^{\circ}
\end{aligned}
\]
\(\therefore\) The sum of the exterior angles of a triangle is \(360^{\circ}\).
Example 12: Find the angles x and y in the following figures.

Solution : (i)

\[
\text { (i) } \begin{aligned}
\angle \mathrm{BAC}+\angle \mathrm{CBA} & =\angle \mathrm{ACD}(\text { exterior angle property }) \\
x^{\circ}+50^{\circ} & =120^{\circ} \\
x^{\circ} & =120^{\circ}-50^{\circ}=70^{\circ} \\
\angle \mathrm{ACB}+\angle \mathrm{ACD} & =180^{\circ} \quad \text { (linear pair) } \\
y^{\circ}+120^{\circ} & =180^{\circ} \\
y^{\circ} & =180^{\circ}-120^{\circ}=60^{\circ} \\
\text { (ii) } \quad \angle \mathrm{ACB}=\angle \mathrm{FCE} & =92^{\circ} \quad \quad \text { (vertically opposite angles) } \\
\angle \mathrm{BAC} & =\angle \mathrm{CBA} \quad \text { (opposite angles of equal sides) }
\end{aligned}
\]

In \(\triangle \mathrm{ABC}\),
\[
\begin{aligned}
\angle \mathrm{BAC}+\angle \mathrm{CBA}+\angle \mathrm{ACB} & =180^{\circ} \quad \text { (angle-sum property) } \\
x^{\circ}+x^{\circ}+92^{\circ} & =180^{\circ} \\
2 x & =180^{\circ}-92^{\circ}=88^{\circ}
\end{aligned}
\]
\[
\therefore x^{\circ} \quad=\frac{88}{2}=44^{\circ}
\]
\[
\text { Also } \quad \begin{aligned}
\angle \mathrm{CBA}+y^{\circ} & =180^{\circ} \quad \text { (linear pair) } \\
y^{\circ} & =180^{\circ}-x^{\circ} \\
\therefore y^{\circ} & =180^{\circ}-44^{\circ}=136^{\circ}
\end{aligned}
\]

Example 13: Find the value of \(\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}+\angle \mathrm{D}+\angle \mathrm{E}\) of the following figure.
Solution: Mark the angles as shown in the figure.
In \(\triangle \mathrm{GHC}, \angle 3+\angle 6+\angle 7=180^{\circ}\)
(angle-sum property of triangle)
In \(\triangle \mathrm{EHB}, \angle 6=\angle 5+\angle 2\)
In \(\triangle \mathrm{AGD}, \angle 7=\angle 1+\angle 4\)

(exterior angle property of a triangle)
Substituting (2) and (3) in (1)
\[
\Rightarrow \quad \angle 3+\angle 5+\angle 1+\angle 2+\angle 4 \quad=180^{\circ}
\]
\(\Rightarrow \quad \angle 1+\angle 2+\angle 3+\angle 4+\angle 5 \quad=180^{\circ}\)
Therefore, \(\angle \mathrm{A}+\angle \mathrm{B}+\angle \mathrm{C}+\angle \mathrm{D}+\angle \mathrm{E}=180^{\circ}\)

\section*{Exercise - 5.4}
1. In \(\triangle \mathrm{ABC}\), name all the interior and exterior angles of the triangle.

2. For \(\triangle \mathrm{ABC}\), find the measure of \(\angle \mathrm{ACD}\).

3. Find the measure of angles \(x\) and \(y\).

4. In the following figures, find the values of \(x\) and \(y\).

5. In the figure \(\angle \mathrm{BAD}=3 \angle \mathrm{DBA}\), find \(\angle \mathrm{CDB}, \angle \mathrm{DBC}\) and \(\angle \mathrm{ABC}\).

6. Find the values of x and y in the following figures.

(i)

(iv)

(ii)

(v)

(iii)

(vi)
7. One of the exterior angles of a triangle is \(125^{\circ}\) and the interior opposite angles to it are in the ratio \(2: 3\). Find the angles of the triangle.
8. The exterior \(\angle \mathrm{PRS}\) of \(\triangle \mathrm{PQR}\) is \(105^{\circ}\). If \(\mathrm{Q}=70^{\circ}\), find \(\angle \mathrm{P}\). Is \(\angle \mathrm{PRS}>\angle \mathrm{P}\) ?
9. If an exterior angle of a triangle is \(130^{\circ}\) and one of the interior opposite angle is \(60^{\circ}\). Find the other interior opposite angle.
10. One of the exterior angle of a triangle is \(105^{\circ}\) and the interior opposite angles are in the ratio \(2: 5\). Find the angles of the triangle.
11. In the figure find the values of \(x\) and \(y\).

\section*{Looking Back}

1 (i) A triangle is a simple closed figure made up of three line segments.
(ii) Based on the sides, triangles are of three types
- Atriangle having all three sides of same length is called an Equilateral Triangle.

A triangle having at least two sides of equal length is called an Isosceles Triangle.
- If all the three sides of a triangle are of different length, the triangle is called a Scalene Triangle.
(iii) Based on the angles, triangles are of three types
- A triangle whose all angles are acute is called an acute-angled triangle.
- A triangle whose one angle is obtuse is called an obtuse-angled triangle.
- A triangle whose one angle is a right angle is called a right-angled triangle.
2. The six elements of a triangle are three angles and the three sides.
3. Properties of the lengths of the sides of a triangle:
(i) The sum of the lengths of any two sides of a triangle is greater than the length of the third side.
(ii) The difference between the lengths of any two sides of a triangle is smaller than the length of the third side.
4. The line segment joining a vertex of a triangle to the mid-point of its opposite side is called a median of the triangle. A triangle has 3 medians.
5. The perpendicular line segment from a vertex of a triangle to its opposite side is called the altitude of the triangle.
6. The total measure of the three angles of a triangle is \(180^{\circ}\). This is called the angle sum property of a triangle.
7. The measure of any exterior angle of a triangle is equal to the sum of its interior opposite angles. This is called the exterior angle property of the triangle.

Note: \(L M=\) Length of Line segment of \(L M ; \overline{L M}=\) Line segment \(L M\)
\[
\overrightarrow{\mathrm{LM}}=\text { Ray LM } \quad ; \quad \overleftrightarrow{\mathrm{LM}}=\text { Line LM }
\]

\subsection*{6.0 Introduction}

In your previous class, you have learnt how to use ratio and proportion to compare quantities. In this class, we will first review our understanding of the same and then learn about ratios expressed in the form of percentages.

\subsection*{6.1 Ratio}
- Madhuri's weight is 50 kg and her daughter's weight is 10 kg . We say that Madhuri's weight is 5 times her daughter's weight. We can also say that the daughter's weight is one-fifth of her mother's weight. Thus, the ratio of Madhuri's weight to her daughter's weight is \(50: 10\) or \(5: 1\). Inversely, the ratio of the daughter's weight to her mother's weight is \(1: 5\).
- In a class there are 60 boys and 40 girls. The number of boys is \(\frac{3}{2}\) times the number of girls. we can also say that the number of girls is two-thirds of the boys. Thus, the ratio of the number of boys to the number of girls is \(60: 40\) or \(3: 2\). Inversely, the ratio of number of girls to number of boys is \(2: 3\).

Anand has a wire of length 100 cm and Rashmi has a wire of length 5 m . Anand said to Rashmi, "the wire with me is 20 times longer than yours." You know that this is not true as 5 m is much longer than 100 cm . The length of Rashmi's wire has been expressed in meters and that of Anand has been expressed in centimeters. Both have to be expressed in the same units before they are compared.

We know that \(1 \mathrm{~m}=100 \mathrm{~cm}\). So the length of the wire with Rashmi is \(5 \mathrm{~m}=5 \times 100=500 \mathrm{~cm}\). Thus, the ratio of Rashmi and Anand's wire is \(500: 100\) or \(5: 1\). We can also say that the length of Rashmi's wire is 5 times that of Anand.

In all the above examples quantities have been comapred in the form of ratios. Thus, a ratio is an ordered comparison of quantities of the same units. We use the symbol ' \(:\) ' to represent a ratio. The ratio of two quantities \(a\) and \(b\) is \(a\) : \(b\) and we read this as " \(a\) is to \(b\) '. The two quantities ' \(a\) ' and ' \(b\) ' are called terms of the ratio. The first quantity ' \(a\) ' is called first term or antecedent and the second quantity ' \(b\) ' is called second term or consequent.

\section*{Try This}

Think of some real life situations in which you have to compare quantities in the form of a ratio.

\section*{Exercise - 6.1}
1. What is the ratio of ` 100 and ` 10 ? Express your answer in the simplest form.
2. Sudha has `5. Money with Radha is 3 times the money with Sudha. How much money does Radha have?
a) What is the ratio of Radha's money and Sudha's money?
b) What is the ratio of Sudha's money and Radha's money?
3. A rectangle measures 40 cm at its length and 20 cm at its width. Find the ratio of the length to the width.
4. The speed of a Garden-Snail is 50 meters per hour and that of the Cheetah is 120 kilometers per hour. Find the ratio of their speeds.
5. Divide 96 chocolates between Raju and Ravi in the ratio \(5: 7\)
6. The length of a line segment \(A B\) is 38 cm . A point \(X\) on it divides it in the ratio \(9: 10\). Find the lengths of the line segments \(A X\) and \(X B\).

7. A sum of ` \(1,60,000\) is divided in the ratio of \(3: 5\). What is the smaller share?
8. To make green paint, a painter mixes yellow paint and blue paint in the ratio of \(3: 2\). If he used twelve liters of yellow paint, how much blue paint did he use?
9. Find a) The ratio of boys to girls in your class.
b) The ratio of number of doors to number of windows of your classroom.
c) The ratio of number of text books to number of note books with you

\section*{Project Work}
1. Take a tape and with the help of your friend measure the length and breadth of your classroom Find the ratio of length and breadth.
2. Take a ` 10 note. Find its length and breadth. Roundoff the answers to the nearest whole number, with the help of your teacher, find the ratio of the length and breadth.
Repeat this activity with ` 20 and ` 50 notes and record the lengths in your note book.

\subsection*{6.2 Proportion}

Srilekha's mother prepares tea by using 2 spoons of tea powder for 1 cup of tea. One day 3 guests visited their home. How many spoons of tea powder must she use to prepare 3 cups of tea? Yes, you are right. She uses 6 spoons of tea powder to prepare 3 cups of tea. Here, Srilekha's mother used the 'law of proportion' to solve the problem.
Let us see one more example:
Ravi took a photo. He got the picture developed in a photo lab in a size \(4 \mathrm{~cm} \times 6 \mathrm{~cm}\).

He wanted to get the photo enlarged so he went to the photo lab again. The lab-man gave him this photo. In turn Ravi
 said, "there seems to be something wrong with this picture". Do you think, is Ravi right?
Can you say what is wrong with this picture?
Ravi decided to measure the length and breadth of the photo. He knew that the ratio of length and breadth of the original photo should be equal to the ratio of length and breadth of the enlarged photo.

Ratio of length and breadth of the original photo \(=4: 6=2: 3\)
Ratio of length and breadth of the enlarged photo \(=4: 12=1: 3\)
Are the two ratios equal? Ravi also realised that the ratio of length and breadth of the enlarged photo was not equal to that of the original photo. He understood that the second picture was not proportionate to the first.
He asked the lab-man to develop another enlarged photo. This time the photo was good. He again measured the length and breadth and calculated the ratio.

Ratio of length and breadth \(=8: 12=2: 3\)
Now, Ravi understood that the original photo and the new enlarged photo looked fine to him because the ratios of their length and breadth were equal i.e., they were in proportion.

Thus, two ratios are said to be in proportion when they are equal. The symbol we use for propotion is ' \(:: \prime\) ' (is as). If two ratios \(\mathbf{a}: \mathbf{b}\) and \(\mathbf{c}: \mathbf{d}\) are equal, we write \(\mathbf{a}: \mathbf{b}=\mathbf{c}: \mathbf{d}\) or \(\mathbf{a}: \mathbf{b}: \mathbf{: c}: \mathbf{d}\). We read this as ' \(\mathbf{a}\) is to \(\mathbf{b}\) is proportionate to \(\mathbf{c}\) is to \(\mathbf{d}\) '. This can also be read as ' \(\mathbf{a}\) is to \(\mathbf{b}\) is as \(\mathbf{c}\) is to
 d'.

The four quantities \(\mathrm{a}, \mathrm{b}, \mathrm{c}\) and d are called first, second, third and fourth terms respectively. The first and fourth terms are known as extreme terms or extremes. The second and third terms are known as middle terms or means.

In a proportion, \(\quad \mathrm{a}: \mathrm{b}=\mathrm{c}: \mathrm{d}\)
\[
\text { i.e. } \frac{a}{b}=\frac{c}{d}
\]

Therefore, \(\quad \mathrm{ad}=\mathrm{bc}\)
Thus, The product of the means is equal to the product of the extremes.
i.e.,

Means
\(\mathrm{a}: \overline{\mathrm{b}=\mathrm{c}}: \mathrm{d}\)

\section*{Extremes}

Here ' d ' is called the fourth proportional and \(\mathrm{d}=\frac{b . c}{a}\)
Let us observe some examples
Example 1: Find \(\square\) to complete the proportion.
(i) \(2: 5=6\) :

Solution: The product of the means is equal to the product of the extremes,
i.e. \(\quad 2: \sqrt{5=6}: \square\)

Therefore, \(\quad 2 \times \square=5 \times 6\)
\[
\square=\frac{30}{2}=15
\]
(ii) \(16: 20=\square: 35\)

The product of the means is equal to the product of the extremes,
i.e.

Therefore,
\[
\begin{aligned}
20 \times \square & =16 \times 35 \\
\square & =\frac{560}{20}=28 \\
\therefore \quad 6: 20 & =28: 35
\end{aligned}
\]

\section*{Exercise - 6.2}
1. Find the missing numbers in the following proportions in the table given below .
\begin{tabular}{|c|l|c|c|}
\hline S.No. & Proportion & Product of extremes & Product of means \\
\hline (i) & \(1: 2:: 4: 8\) & & \\
\hline (ii) & \(5: 6:: 75: 90\) & & \\
\hline (iii) & \(3: 4:: 24: 32\) & & \\
\hline (iv) & \(2: 5:: \square: 15\) & 30 & \\
\hline (v) & \(3: 6:: 12: \square\) & & 72 \\
\hline
\end{tabular}
2. State true or false.
(i) \(15: 30:: 30: 40\)
(ii) \(22: 11:: 12: 6\)
(iii) \(90: 30:: 36: 12\)
(iv) \(32: 64:: 6: 12\)
(v) \(25: 1:: 40: 160\)

3 Madhu buys 5 kg of potatoes at the market. If the cost of 2 kg is ₹. 36 , how much will Madhu pay?
4. A man whose weight is 90 kgs weighs 15 kg on the moon, what will be the weight of a man on the moon whose weight is 60 kg ?
5. A disaster relief team consists of engineers and doctors in the ratio of \(2: 5\).
(i) If there are 18 engineers, find the number of doctors.
(ii) If there are 65 doctors, find the number of engineers.
6. The ratio of two angles is \(3: 1\). Find the
(i) larger angle if the smaller is \(180^{\circ}\)
(ii) smaller angle if the larger is \(63^{\circ}\).

\section*{Do This}

Enlarge the square and rectangle in the figure given below such that the enlarged square and rectangle remain proportional to the original square and rectangle.

\subsection*{6.3 Rate}

Sometimes ratios are expressed as rates. Some examples are given below :
i) My father drives the vehicle with a speed of 60 km per hour.
ii) I bought apples at the rate of ₹ 120 per kg.
iii) My heart beat rate is 72 per minute.
iv) The cost of eggs is ₹ 60 per dozen.
v) The birth rate of India is 21 (approximately). (Birth rate is the number of live births per thousand people in a given time -

Refer: http://www.indexmundi.com/g/g.aspx?c=in\&v=25)
In the first example the distance travelled by the vehicle is compared with the time taken. In the second example cost of apples is compared to the quantity of apples. In the third example the number of heart beats is compared to the time taken. In the fourth example, the cost of eggs is compared to the quantity of eggs. In the fifth example, the number of live births is compared to 1000 poeple.

The above examples can be written as \(60 \mathrm{~km} /\) hour, ₹ \(120 / \mathrm{kg}\), 72 beats/ minute, ₹ \(60 /\) dozen and 21 births per 1000 people.

\subsection*{6.4 Unitary Method}

The method in which we first find the value of one unit and then the value of the required number of units is known as unitary method.

Example 2: A shopkeeper sells 5 tumblers for ₹ 30 . What would be the cost of 10 such tumblers?
Solution: Cost of 5 tumblers \(=₹ 30\)
Therefore, Cost of 1 tumbler \(=\frac{30}{5}=₹ 6\)
Thus, cost of 10 tumblers \(=6 \times 10=₹ 60\).
Example 3: What is the cost of 9 bananas, if the cost of a dozen bananas is ` 20 ?
Solution: 1 dozen \(=12\) units.
Cost of 12 bananas = ₹ 20
Therefore, cost of 1 banana \(=₹ \frac{20}{12}\)
Thus, cost of 9 bananas \(=\frac{20}{12} \times 9=₹ 15\)

\section*{Do This}
1. 40 benches are required to seat 160 students. How many benches will be required to seat 240 students at the same rate?
2. When a Robin bird flies, it flaps wings 23 times in ten seconds. How many times will it flap its wings in 2 minutes?"
3. The average human heart beats at 72 times per minute. How many times does it beat in 15 seconds? How many in an hour? How many in a day?

\subsection*{6.5 Direct Proportion}

There are various situations in day-to-day life, when a change in one quantity leads to a change in the other quantity.

For example:
- If the number of things purchased increases, the cost incurred also increases. Alternately, if the number of things purchased decreases, the cost incurred also decreases.
- If the money deposited with a bank increases, the interest earned on that sum also increases. Alternately, if the money in the bank decreases, the interest also decreases.
- At a constant speed, if the distance travelled increases, the time taken for it also increases. Alternately, if the distance travelled decreases, time also decreases.

In the above examples, when one quantity increases the other also increases and vice-versa. Let us understand such situations with the help of an example.

A tap takes 1 hour to fill 300 litres of a tank. How many litres will be filled up in 2 hours?
The tank will be filled up by 600 litres in 2 hours. How many litres of water will be filled up in 8 hours? How do you make this calculation?

Look at the table given below :

You will find that in each case above, if the time taken increases the quantity of water filled also increases such that the ratio of the time taken and the ratio of the quantity filled is same. Thus, when the time taken doubles, the quantity filled will also doubled; when the time taken is 4 times, the quantity filled is also four times the original. And when the time taken is 8 times, the quantity filled is also 8 times. The ratio of the time taken is \(1: 2\) and the ratio of quantity filled is also \(1: 2\). Thus, we can say that time taken to fill the tank and quantity filled are in direct proportion.

Example 4: A shopkeeper sells 6 eggs for ₹ 30 . What would be the cost of 10 eggs?
Solution : Let the cost of 10 eggs be ₹ \(x\).
We know that as the number of eggs increases, the cost will also increase such that the ratio of the number of eggs and the ratio of their costs will remain the same. In other words, the ratio of the number of eggs and the ratio of the cost of eggs is in proportion.

Thus, \(\quad 6: 10=30: x\)
Since the product of the means is equal to the product of the extremes :
\(6 \times x=10 \times 30\)
\[
\begin{aligned}
& 6 x=10 \times 30 \\
& x=\frac{10 \times 30}{6}=50
\end{aligned}
\]
\(x=₹ 50\)
Thus, the cost of 10 eggs is equal to ₹ 50 .
This problem can be solved by using unitary method too i.e. finding the cost of one egg and then multiplying the unit cost with the number of eggs required.
Cost of 6 eggs \(=₹ 30\)
Therefore, cost of 1 egg \(=\frac{30}{6}=₹ 5\)
Cost of 10 eggs \(=5 \times 10=₹ 50\)

Example 5: 20 kgs of rice is needed for a family of 4 members. How many kgs of rice will be required if the number of members in the house increases to 10 ?

Method 1: As the number of members increases, the quantity of rice required will also increase such that the ratio of number of members and the ratio of the quantity of rice is the same. Thus, the number of members and quantity of rice are in direct proportion.
Solution: Let \(x\) be the quantity of rice required for 10 members
Then \(\quad x: 20=10: 4\)
Since the product of the means is equal to the product of the extremes:
\[
\begin{gathered}
4 x=20 \times 10 \\
x=\frac{20 \times 10}{4}=50 \\
x=50 \mathrm{kgs}
\end{gathered}
\]
\(\therefore\) The quantity of Rice required for 10 members \(=50 \mathrm{Kgs}\).

\section*{Method 2: Unitary method}

The quantity of Rice required for 4 members \(=20 \mathrm{kgs}\).
Thus, quantity of Rice required for one member \(=\frac{20}{4}=5 \mathrm{kgs}\).
\(\therefore\) The quantity of Rice required for 10 members \(=10 \times 5=50 \mathrm{kgs}\).
Example 6: A jeep travels 90 km in 3 hours at a constant speed. In how many hours will the jeep cover 150 kms ?

We know that as the distance travelled increases the time taken will also increase such that the ratio of the distances travelled and the ratio of the times taken is the same. Thus, the distance travelled and the time taken is directly proportional.

Solution: Let \(x\) be the number of hours for the jeep to cover 150 kms .
Thus, \(x: 3=150: 90\)
Since the product of the means is equal to the product of the extremes
\(90 x=150 \times 3\)
\(x=\frac{150 \times 3}{90}=5\)
\(x=5\)
Therefore, time taken to cover \(150 \mathrm{Km}=5\) hours.

Example 7: The scale of a map is given as 1:30000. Two cities are 4 cm apart on the map. Find the actual distance between them.

Solution : Let the actual distance be x cm . Since the distance on the map is directly proportional to the actual distance,
\[
1: 30000=4: x
\]

Since the product of the means is equal to the product of the extremes
\[
\begin{aligned}
& x=4 \times 30,000 \\
& =1,20,000 \mathrm{~cm} \\
& =1.2 \mathrm{kms} \quad(1 \mathrm{~km}=1,00,000 \mathrm{~cm})
\end{aligned}
\]

Thus, two cities, which are 4 cm apart on the map, are actually 1.2 kms away from each other.

\section*{Try This}
1. Place a 1 litre empty bottle under a tap from which water is falling drop by drop due to leakage. How muchtime did it take to fill the bottle? Calculate how much water would be wasted in a year?
2. Take a clock and fix its minutes hand at 12 .

Note the angles made by minutes hand in the given intervals of time :
\begin{tabular}{|l|l|l|l|l|}
\hline Time Passed & \(\left(\mathrm{T}_{1}\right)\) & \(\left(\mathrm{T}_{2}\right)\) & \(\left(\mathrm{T}_{3}\right)\) & \(\left(\mathrm{T}_{4}\right)\) \\
\hline (in minutes) & 15 & 30 & 45 & 60 \\
\hline Angle turned & \(\left(\mathrm{A}_{1}\right)\) & \(\left(\mathrm{A}_{2}\right)\) & \(\left(\mathrm{A}_{3}\right)\) & \(\left(\mathrm{A}_{4}\right)\) \\
\hline (indegree) & 90 & \(\ldots\) & \(\ldots\) & \(\cdots\) \\
\hline
\end{tabular}

Is the angle turned through by the minute hand directly proportional to the time that has passed? Yes!
From the above table, you can also see
\(\mathrm{T}_{1}: \mathrm{T}_{2}=\mathrm{A}_{1}: \mathrm{A}_{2}\), because
\(\mathrm{T}_{1}: \mathrm{T}_{2}=15: 30=1: 2\)
\(\mathrm{A}_{1}: \mathrm{A}_{2}=90: 180=1: 2\)
Check if \(\mathrm{T}_{2}: \mathrm{T}_{3}=\mathrm{A}_{2}: \mathrm{A}_{3}\) and \(\mathrm{T}_{3}: \mathrm{T}_{4}=\mathrm{A}_{3}: \mathrm{A}_{4}\)
You can repeat this activity by choosing your own time interval.

\section*{Exercise - 6.3}
1. A length of a bacteria enlarged 50,000 times attains a length of 5 cm . What is the actual length of the bacteria? If the length is enlarged 20,000 times only, what would be its enlarged length?

2. Observe the following tables and find if x is directly proportional.
(i)
\begin{tabular}{|l|l|l|l|l|l|l|l|}
\hline x & 20 & 17 & 14 & 11 & 8 & 5 & 2 \\
\hline y & 40 & 34 & 28 & 22 & 16 & 10 & 4 \\
\hline
\end{tabular}
(ii)
\begin{tabular}{|l|l|l|l|l|l|l|l|}
\hline x & 6 & 10 & 14 & 18 & 22 & 26 & 30 \\
\hline y & 4 & 8 & 12 & 16 & 20 & 24 & 28 \\
\hline
\end{tabular}
(iii)
\begin{tabular}{|l|l|l|l|l|l|l|l|}
\hline x & 5 & 8 & 12 & 15 & 18 & 20 & 25 \\
\hline y & 15 & 24 & 36 & 60 & 72 & 100 & 125 \\
\hline
\end{tabular}
3. Sushma has a road map with a scale of 1 cm representing 18 km . She drives on a road for 72 km . What would be her distance covered in the map?
4. On a Grid paper, draw five squares of different sizes. Write the following information in a tabular form.
\begin{tabular}{|l|l|l|l|l|l|}
\hline & Square 1 & Square 2 & Square 3 & Square 4 & Square 5 \\
\hline Length of a side (L) & & & & & \\
\hline Perimeter (P) & & & & & \\
\hline Area (A) & & & & & \\
\hline
\end{tabular}

Find whether the length of a side is in direct proportion to:
(i) the perimeter of the square.
(ii) the area of the square.

Ratios also appear in the form of percentages. We will learn about percentages and the various ways in which we use them in day-to-day life.

\section*{6.6 \\ Percentages}
- Soumya got 65\% marks in Mathematics and Ranjeet got \(59 \%\) marks.
- A cloth seller in whole-sale market makes a profit of \(25 \%\) on silk sarees in the retail-market makes a profit of \(10 \%\).
- Anita borrowed a loan of ` 10000 from the bank for one year. She has to pay a \(10 \%\) interest at the end of the year.
- During festival season a T.V. seller was offering a discount of \(10 \%\) and another was offening a discount of \(15 \%\).

The word 'percent' means 'per every hundred' or 'for a hundred'. The symbol '\%' is used to represent percentage. Thus, \(1 \%\) (one percent) means 1 out of a 100; \(27 \%\) ( 27 percent) means 27 out of 100 and \(93 \%\) (ninty three percent) means 93 out of a 100 .
\(1 \%\) can also be written as \(\frac{1}{100}\) or 0.01
\(27 \%\) can also be written as \(\frac{27}{100}\) or 0.27
\(93 \%\) can also be written as \(\frac{93}{100}\) or 0.93

\section*{Do This}
1. Given below are various grids of 100 squares. Each has a different number of squares coloured. In each case, write the coloured and white part in the form of a (1) Percentage, (2) Fraction and (3) Decimal.

2. Look at the grid paper given below and answer the following.

What percent represents ?
What percent represents ?
What percent represents ?
What percent represents ?
3. The strength particular of a school are given below. Express the strength of eachclass as a fraction, percentage of total strength of the school.
\begin{tabular}{|c|c|l|l|}
\hline Class & No. of children & As a fraction & As a percentage \\
\hline VI & 17 & & \\
\hline VII & 15 & & \\
\hline VIII & 20 & & \\
\hline IX & 30 & & \\
\hline X & 18 & & \\
\hline Total & 100 & & \\
\hline
\end{tabular}

In all the above examples the total number is 100 . How do we find percentages when the total is not hundred?

Example. 8: In a class there are 35 girls and 15 boys. What is the percentages of boys and what is the percentage of girls?

Solution: Sudhir solved it like this;
Method-1
\begin{tabular}{|l|c|c|c|c|}
\hline Student & Number & Fraction & \begin{tabular}{c} 
Converting denominator into \\
hundred
\end{tabular} & As a percentage \\
\hline Girls & 35 & \(\frac{35}{50}\) & \(\frac{35}{50} \times \frac{100}{100}=\frac{70}{100}\) & \(70 \%\) \\
\hline Boys & 15 & \(\frac{15}{50}\) & \(\frac{15}{50} \times \frac{100}{100}=\frac{30}{100}\) & \(30 \%\) \\
\hline Total & 50 & & & \\
\hline
\end{tabular}

\section*{Method - 2}

Anwar found the percentage of girls and boys like this.

Total students \(35+15=50\)
Out of 50 students there are 35 girls
Thus, out of 100 students there will be \(\frac{35}{50} \times 100=70\) girls

\section*{Method-3}

Reena solved it like this. \(\frac{35}{50} \times \frac{2}{2}=\frac{70}{100}=70 \%\)

We see that there are three methods that can be used to find percentage when the total does not add up to 100. In the first table, we multiply the fraction by \(\frac{100}{100}\). This does not change the value of the fraction. Subsequently, only 100 remains in the denominator. Reena has multiplied by it \(\frac{2}{2}\) to get 100 in the denominator. Anwar has used the unitary method. You can choose any of the methods or you can also find your own method.

Does Anwar's method work for all ratios? Does the method be used by Reena also work for all ratios?

Anwar says Reena's method can be used only if you can find a natural number which on multiplication with the denominator gives 100 . Since denominator was 50 , she could multiply it by 2 to get 100 . If the denominator was 60 , she would not have been able to use this method. Do you agree?

Example 9: Shirt "A" has \(\frac{3}{5}\) cotton where as shirt "B" has \(\frac{3}{4}\) cotton.
(i) What is the percentage of cotton in each shirt?
(ii) Which shirt has more percentage of cotton?

Solution: The percentage of cotton in shirt "A" \(=\frac{3}{5} \times 100=60 \%\)
The percentage of cotton in shirt "B" \(=\frac{3}{4} \times 100=75 \%\)
shirt " B "has more percentage of cotton.

Example 10: Ganga went to a tailor with 1 mt . cloth. She asked him to make a blouse to her. The tailor used 0.75 mts of cloth to make the blouse and returned the remaining cloth to Ganga.

What percentage of the cloth (i) is used in making the blouse (ii) is given back to Ganga?

Solution : The tailor used 0.75 mts of cloth.
The percentage of cloth used \(=0.75 \times 100 \%\)

\[
\begin{aligned}
& =\frac{75}{100} \times 100 \% \\
& =75 \%
\end{aligned}
\]

The tailor returned \(1-0.75=0.25 \mathrm{mts}\) of cloth.

The percentage of cloth returned \(=0.25 \times 100 \%\)
\[
\begin{aligned}
& =\frac{25}{100} \times 100 \% \\
& =25 \%
\end{aligned}
\]

Example 11: Last year the cost of a commodity was ` 40 . This year, the cost of the comodity increased to ` 50 . What is the percentage change in its price?

Solution: Percentage increase in price \(=\frac{\text { change in amount }}{\text { original amount }} \times 100 \%\)

\[
\begin{aligned}
& =\frac{50-40}{40} \times 100 \% \\
& =\frac{10}{40} \times 100 \%=\frac{1000}{40} \%=25 \%
\end{aligned}
\]

Example 12: Shyam's monthly income is ` 10,000 . He spends \(60 \%\) of it on family expenses, \(10 \%\) on medical expenses, \(5 \%\) on donations and saves by \(25 \%\). Find the amount he spends on each item?

Solution: Amount spent on family expenses \(=\frac{60}{100} \times 10000=₹ 6000\)

Similarly, amount spent on medical expenses \(=\frac{10}{100} \times 10000=₹ 1000\)

Amount spent on donations \(\quad=\frac{5}{100} \times 10000=₹ 500\)

Amount saved
\[
=\frac{25}{100} \times 10000=₹ 2500
\]

\section*{Exercise - 6.4}
1. In a school \(X, 48\) students appeared for 10 th class exam out of which 36 students passed. In another school Y, 30 students appeared and 24 students passed. If the District Educational Officer wants to give an award on the basis of pass percentage. To which school will he give the award?
2. Last year the cost of 1000 articles was ₹ 5000 . This year it goes down to ₹ 4000 . What is the percentage of decrease in price?
3. \(64 \%+20 \%+\ldots . ? \ldots \ldots . .=100 \%\)
4. Sri Jyothi has a basket full of bananas, oranges and mangoes. If 50\% are bananas, \(15 \%\) are oranges, then what percent are mangoes?
5. On a rainy day, out of 150 students in a school 25 were absent. Find the percentage of students absent from the school? What percentage of students is present?
6. Out of 12000 voters in a constituency, \(60 \%\) voted. Find the number of people voted in the constituency?
7. A local cricket team played 20 matches in one season. If it won \(25 \%\) of them and lost rest. How many matches did it loose?
8. In every gram of gold, a goldsmith mixes 0.25 grams of silver and 0.05 grams of copper. What is the percentage of gold, silver and copper in every gram of gold?
9. \(40 \%\) of a number is 800 then find the number?

\section*{Try This}
1. Population of our country as per 2011 census is about \(12 \times 10^{8}(120,00,00,000)\) If the population of our country increases by \(3 \%\) every year what will be the population by 2012 ?
2. (i) Can you eat \(75 \%\) of a dosa?
(ii) Can the price of an item go up by \(90 \%\) ?
(iii) Can the price of an item go up by \(100 \%\) ?

\subsection*{6.7 Some situations in which we use percentages}

We use percentages to express profit and loss, discount and interest. Expressing these in percentages makes comparisons easy.

\subsection*{6.7.1 Profit and Loss}
- A potter makes pots on the wheel, then bakes them in a kiln and decorates them with paint. He spends ₹ 3 on material, \(₹ 2\) on baking and ₹ 1 on painting the each pot. He sells each pot for \({ }^{`} 10\). Does the potter make profit or loss?

- A toy maker makes a toy for ₹ 50 and sells it for ₹ 75 . Does he make profit or loss?
- A trader buys shirts at ₹ 540 each. The shirts remain unsold till the end of the year. The trader sells them at ₹ 500 each at year end. Did the trader make a profit or a loss?
- Amar is a gold merchant. He bought 10 gms of gold worth ₹ 15000 in the last year. Now its rate has gone up to ₹ 20000 . Will Amar make a profit or a loss on selling the gold at present rate?

In each of the above situations, you can calculate the amount of profit or loss. However, many a times percentages are used in expressing the profit or loss made in a transaction.

Example 13: Ramayya bought some pens for ₹ 200 and he sold them for ₹ 240 whereas Somayya bought some pens for ₹ 500 and he sold them for ₹ 575 . Who made more profit?

Solution : To find the profit we compare selling price to the cost price.
Profit \(=\) selling price - cost price or \(\mathrm{P}=\mathrm{SP}-\mathrm{CP}\)
Ramayya's Profit =₹ \(240-₹ 200=₹ 40\)
Somayya's Profit =₹ \(575-₹ 500=₹ 75\)
It appears like Somayya made more profit as he made a profit of ₹ 75 whereas Ramayya made a profit of ₹ 40 only. Is this correct?

Ramayya made a profit of ₹ 40 when he invested an amount of ₹ 200 whereas Somayya made a profit of ₹ 75 whenhe invested an amount of ₹ 500 .

Thus, Ramayya's ratio of profit to cost price \(=\frac{40}{200}\) and
Somayya's ratio of profit to cost price \(=\frac{75}{500}\)

To compare profit, cost ratios we convert them in to percentages.
Profit percentage \(=\frac{\text { Profit }}{\mathrm{CP}} \times 100\)

Thus, Ramayya's profit percentage
\(=\frac{40}{200} \times 100 \%=20 \%\)
Somayya's profit percentage \(=\frac{75}{500} \times 100 \%=15 \%\)
Ramayya earn a profit of \(20 \%\) or ₹ 20 on investment of \(₹ 100\).
Somayya earns a profit of \(15 \%\) or \(₹ 15\) on investment of \(₹ 100\).
Thus, Ramaya earns more profit than Somayya.

Example 14: A shop keeper bought a TV for ` 9000 and he sold it for \({ }^{`} 10,000\). Find the profit or loss? calculate percentage.

\section*{Solution: Gopal solved the problem in the following way:}

Cost price (CP) of the TV =` 9000
Selling price \((\mathrm{SP})\) of the \(\mathrm{TV}=` 10,000\)

As SP is greater than CP, the shopkeeper makes a profit:
Profit \((\mathrm{P})=₹ 10000-₹ 9000=₹ 1000\)
Thus, when the CP is ₹ 9000 , the shopkeeper makes a profit of ₹ 1000
The ratio of profit and cost is \(\frac{1000}{9000}\)
To find the profit percentage we multiply this ratio with \(100 \%\)
i.e. \(\frac{1000}{9000} \times 100 \%=\frac{100}{9} \%=11 \frac{1}{9} \%\)

\section*{Madhu solved this problem using proportion.}

When the CP is ₹ 9000 , the profit is ₹ 1000 .
Now, when CP is \(₹ 100\), let the profit be \(₹ x\).
We know that the CP and profit are directly proportional thus, ratio of profit and the ratio of cost price (CP) will be same in both cases.

Therefore, \(x: 1000=100: 9000\)
\[
\frac{x}{1000}=\frac{100}{9000}
\]
\(9000 \times \mathrm{x}=1000 \times 100\)
\(x=\frac{1000 \times 100}{9000}=11 \frac{1}{9}\).
Thus, the profit \(\%=11 \frac{1}{9} \%\)

\section*{Try This}

The cost price of 5 mangoes is equal to the selling price of 2 mangoes. Find the profit percent?

Example 15: Suppose a person buys an article for ₹ 650/- and gains 6\% on selling it. Find the selling price?

\section*{Solution: Ravi solved it like this:}
\(C P=₹ 650\)
Gain \(\%=6 \%\)
So, if the CP is \(₹ 100\) then gain is \(₹ 6\) and SP is \(100+6=₹ 106\)
Now, when the CP is ₹ 650 let the SP be ₹ \(x\).
The CP and SP are directly proportional
Therefore, The ratio of \(\mathrm{CP}=\) ratio of SP
\(100: 650=106: x\)
\(\frac{100}{650}=\frac{106}{x}\)
Therefore, \(100 x=106 \times 650\)
Therefore, \(\quad x=\frac{106 \times 650}{100}=689\)
Thus, the \(\mathrm{SP}=\) ₹ 689

\section*{Arun solved it like this:}
\(\mathrm{CP}=₹ 650\)
Profit \(\%=6 \%\)
Thus, profit \(=6 \%\) of 650
\(\frac{6}{100} \times 650=39\)
We know that \(\mathrm{SP}=\mathrm{CP}+\) Profit
Thus, \(\quad \mathrm{SP}=650+39=₹ 689\)

Example 16: Ramesh sold a D.V.D player for ` 2800 at a gain of \(12 \%\). For how much did he buy it?

\section*{Solution: Naik solved it using proportion.}

Gain \% = \(12 \%\)
\(\mathrm{SP}=₹ 2800\)
So, If CP is ₹ 100 , then SP is ₹ 112
When \(\mathrm{SP}=₹ 2800\), let its CP be ₹ \(x\).
CP and SP are directly proportional
Thus, ratio of \(\mathrm{CP}=\) ratio of SP
\(x: 100=2800: 112\)
\(\frac{x}{100}=\frac{2800}{112}\)
Therefore, \(112 \times x=100 \times 2800\)
Therefore, \(x=\frac{100 \times 2800}{112}=₹ 2500\)
Thus, CP =₹ 2500
Meena solved it using unitary method.
S.P = 2800

Gain \(=12 \%\)
If \(C P\) is 100 , then profit is 12
\(\mathrm{SP}=100+12=112\)
So, when SP in ₹ 112 then CP is ₹ 100
Therefore, when SP is 1 then CP is \(\frac{100}{112}\)
Thus, when SP is ₹ 2800 then CP is \(\frac{100}{112} \times 2800=₹ 2500\)
\(\mathrm{CP}=₹ 2500\)

Example 17: A man sold two cycles for ₹ 3000 each, gaining 20\% on one and losing 20\% on the other. Find his gain or loss percentage on the whole transaction?

Solution:
\(\mathrm{SP}=₹ 3000\)
Gain\% on first cycle \(=20 \%\)
Loss \% on second cycle \(=20 \%\)

\section*{Method-1: Using the unitary method}

For first cycle

If CP is ₹ 100 , then the profit is \(₹ 20\) and \(\mathrm{SP}=100+20=₹ 120\)
Thus, if SP is \(₹ 120\) then CP is \(₹ 100\)
Now, if SP is 1 then CP is \(=\frac{100}{120}\)
Now, if SP is ₹ 3000 then \(\mathrm{CP}=\frac{100}{120} \times 3000=₹ 2500\)
For second cycle
If CP is ₹ 100 then the loss is 20 and since Loss \(=\) Cost price - Selling price
Here SP will be \(=100-20=₹ 80\)
Thus, if SP is \(₹ 80\) then CP is \(=₹ 100\)
Now, if SP is Rs. 1 then CP is \(=\frac{100}{80}\)
Now, if SP is ₹ 3000 then CP is \(=\frac{100}{80} \times 3000=₹ 3750\)
Total CP =₹ \(2500+₹ 3750=₹ 6250\)
Total SP =₹ \(3000+₹ 3000=₹ 6000\)
Since SP is less than CP, loss \(=6250-6000=₹ 250\)
Loss \(\%=\frac{\text { loss }}{C P} \times 100=\frac{250}{6250} \times 100=4 \%\)

\section*{Method-2: Using proportion}

On the first cycle:
When CP increases SP will increase, thus CP and SP are in direct proportion.
\begin{tabular}{ll} 
CP & SP \\
100 & 120 \\
\(x\) & 3000 \\
Thus, the ratio of \(\mathrm{CP}=\) ratio of SP
\end{tabular}
\(100: x=120: 3000\)
\(\frac{100}{x}=\frac{120}{3000}\)
\(100 \times 3000=120 x\)
\(\frac{100 \times 3000}{120}=x\)
\(x=2500\)
Thus, CP of first cycle \(=₹ 2500\).

\section*{On the second cycle:}
CP \(\quad\) SP
\(100 \quad 80\)
\(x \quad 3000\)
\(100: x=80: 3000\)
\(\frac{100}{x}=\frac{80}{3000}\)
\(x=\frac{100 \times 3000}{80}=₹ 3750\)

Therefore, total CP of two cycles \(=₹ 2500+₹ 3750=₹ 6250\)
Total SP of cycles \(=₹ 6000\)
Since SP is less than CP , he has a loss
Loss \(=₹ 6250-₹ 6000=₹ 250\)
Therefore, loss percentage \(=\frac{\text { Loss }}{\text { C.P. }} \times 100=\frac{250}{6250} \times 100=4 \%\)

\section*{Method-3:}

SP of first cycle \(=₹ 3000\)
Gain\% = \(20 \%\)
Let the CP be ₹ \(x\)
Then, the profit \(=\frac{20}{100} \times x=\frac{20}{100} x\)

We know that \(\mathrm{SP}=\mathrm{CP}+\) Profit
Thus, \(x+\frac{20}{100} x=3000\)
\(\frac{100 x+20 x}{100}=3000\)
\(\frac{120 x}{100}=3000\)
\(x=\frac{3000 \times 100}{120}=` 2500\)
Thus, CP of the first cycle \(={ }^{`} 2500\)
SP of second cycle \(=` 3000\)
Loss \% = 20\%
Let the CP be ` \(x\)
Then, the loss \(\frac{20}{100} \times x=\frac{20}{100} x\)
We know that \(\mathrm{SP}=\mathrm{CP}-\) loss
Thus, \(x-\frac{20}{100} x=3000\)
\(\frac{80}{100} x=3000\)
\(80 x=3000 \times 100\)
\(x=\frac{3000 \times 100}{80}=` 3750\)
Thus, CP of the second cycle \(={ }^{`} 3750\)
Therefore, total CP of two cycles \(=` 2500+` 3750=` 6250\)
Total SP of cycles =` 6000
Since SP is less than CP , he has a loss
Loss \(=` 6250-` 6000=` 250\)
Therefore, loss \(=\frac{\text { Loss }}{\text { C.P. }} \times 100=\frac{250}{6250} \times 100=4 \%\)

Example 18: The cost of an article goes down every year by \(20 \%\) of its previous value. Find its original cost if the cost of it after 2 years is ₹ 19,200 ?

Solution : \(\quad\) Cost of an article at the end of 2 nd year \(=₹ 19,200\)
The cost decreases every year by \(20 \%\)
Let cost at the beginning of 1 st year be 100 . At the begining of 2 nd year it will be ` 80 (i.e. 100-20\% of 100)

At the begning of the 3 rd year \(=₹ 64(80-20 \%\) of 80\()\)
Thus, an article that costs ₹ 100 will cost ₹ 64 at the begining of third year.
The cost of an article is ₹ 19200 after 2 years
Let the original cost be \(₹ x\).
Thus, ratio of the original cost \(=\) ratio of cost after 2 years
\(x: 100=19200: 64\)
\(\frac{x}{100}=\frac{19200}{64}\)
\(64 x=19200 \times 100\)
\(x=\frac{19200 \times 100}{64}=30000\)
Thus, the original cost of an article was ` 30000 .

\subsection*{6.7.2 Discount}

Situation 1: Complete the table of rates and discounts given below:
\begin{tabular}{|l|l|l|l|l|}
\hline Item & M.P. & Discount \% & Discount & S.P. \\
\hline Sari & 1000 & \(10 \%\) & 100 & \(\ldots \ldots .\). \\
\hline Trousers & 2000 & \(20 \%\) & 400 & \(\ldots . . . .\). \\
\hline Shirt & \(\ldots \ldots .\). & \(\ldots \ldots .\). & 97.50 & 552.50 \\
\hline T-Shirt & 500 & \(25 \%\) & \(\ldots . . . .\). & 375 \\
\hline
\end{tabular}

Situation 2: Complete the table as per the discounts offered.

\begin{tabular}{|l|l|l|l|l|}
\hline Item & C.P. & \begin{tabular}{l} 
Discount \\
\(\%\)
\end{tabular} & \begin{tabular}{l} 
Discount \\
Amount
\end{tabular} & S.P. \\
\hline TV & 5000 & \(15 \%\) & \(\ldots \ldots .\). & \(\ldots \ldots .\). \\
\hline Fridge & 10,000 & \(\ldots \ldots .\). & 1000 & 11,000 \\
\hline Almirah & 4,000 & \(20 \%\) & \(\ldots \ldots .\). & \(\ldots \ldots .\). \\
\hline
\end{tabular}

Situation 3: Some times to clear their old stock or out dated stock, businessmen offer clearance sales in the form of discounts in the following way. What is
 the discount percentage?

Example 19: A shopkeeper marks his goods \(25 \%\) above the cost price and allows a discount of \(12 \%\) on them. What percent does he gain?

Solution: Let the cost price be ₹ 100 .
Then marked price \((\mathrm{MP})=₹ 100+₹ 25=₹ 125\).
Discount percent on marked price \(=12 \%\)
Discount \(=\frac{12}{100} \times 125=₹ 15\)
\(\mathrm{SP}=\mathrm{MP}-\) Discount
\(=125-15=110\)
Gain \(=\mathrm{SP}-\mathrm{CP}\)
\(=110-100\)
= ₹ 10

Gain \(\%=\frac{10}{100} \times 100=10 \%\)
Thus, the shopkeeper gains 10\% after discount.

\section*{Exercise - 6.5}
1. A shopkeeper bought a suit case for \(₹ 480\) and sold it for \(₹ 540\). Find his gain percent?
2. Ajay bought a TV for ₹ 15000 and sold it for \(₹ 14100\). Find the loss percent?
3. Ramu sold a plot of land for ₹ \(2,40,000\) gaining \(20 \%\). For how much did he purchase the plot?
4. On selling a mobile for \(₹ 750\), a shop keeper looses \(10 \%\). For what amount should he sell it to gain \(5 \%\) ?
5. A farmer sold 2 bullocks for ₹ 24000 each. On one bullock he gained \(25 \%\) and on the other he lost \(20 \%\). Find his total profit or loss percent?
6. Sravya bought a watch for \(₹ 480\). She sold it to Ridhi at a gain of \(6 \frac{1}{4} \%\). Ridhi sold it to Divya at a gain of \(10 \%\). How much did Divya pay for it?
7. The marked price of a book is ₹ 225 . The publisher allows a discount of \(₹ 10 \%\) on it. Find the selling price of it?
8. A carpenter allows \(15 \%\) discount on his goods. Find the marked price of a chair which is sold by him for ₹ 680 ?
9. A dealer allows a discount of ₹ \(10 \%\) and still gains by \(10 \%\). What should be the marked price if the cost price is ₹ 900 ?

\subsection*{6.7.3 Simple Interest}

Ramayya has ₹ 10,000 . He requires ₹ 15,000 for agriculture. He approaches an agricultural bank manager. The conversation withthe bank manager is as follows:

Ramayya: Sir, Ineed some money for agricultural purposes.
Bank manager :How much money do you require?
Ramayya: ₹ 5000
Bank manager :How long will you take to repay?
Ramayya: One year.

Bank manager :You have to pay an interest of 6\% on the loan along with the lent amount after one year.
Ramayya: Yes sir, I will repay after one year the whole amount.
Bank manager :Do you know how much you have to pay after one year.
Ramayya: Yes, On ₹ 100 I have to pay ₹ 6 .

So, on ₹ 1 , I have to pay \(₹ \frac{6}{100}\) and on ₹ 5000 , I have to pay \(₹ \frac{6}{100} \times 5000=300\) that is ₹ 300 . Thus, I have to pay a total amount of ₹ 5300 .

The money borrowed or lent out for a certain period is called the Principal ( \(\mathbf{P}\) ). This money would be used by the borrower for some time before it is returned. For keeping this money for some time the borrower has to pay some extra money to the bank. This is known as Interest (I).

The amount that is to be repayed back is equal to the sum of the borrowed principle and the interest. Amount = Principal + Interest i.e. \(\mathbf{A}=\mathbf{P}+\mathbf{I}\)

Interest is generally expressed as percent of the principal for a period of one year. It is written as say \(10 \%\) per year or per annum or in short as \(10 \%\) p.a.
\(10 \%\) p.a. means on every ₹ 100 borrowed, ₹ 10 is the interest you have to pay for one year. Let us take an example and see how this works.

Example 20 : Sunita takes a loan of ₹ 5000 at \(12 \%\) rate of interest. Find the interest she has to pay at the end of one year.

Solution: \(\quad\) Principal \(=₹ 5000\), Rate of interest \(=12 \%\) per year
If ₹ 100 is borrowed, sunita has to pay ₹ 12 interest for one year. Since ₹ \(₹ 000\) is borrowed, the interest she has to pay for one year
\[
=\frac{12}{100} \times 5000=₹ 600
\]

So, at the end of the year she has to pay an amount of ₹ \(5000+₹ 600=₹ 5600\)

In general, when P is principal, \(\mathrm{R} \%\) is rate of interest per annum and I is the interest, the amount to be received at the end of the year is:
\[
\mathrm{A}=\mathrm{P}+\frac{\mathrm{P} \times \mathrm{R}}{100}
\]

If Sunita, due to unavoidable circumstances, can not pay the total amount as requested by the manager in one year then the loan can be extended for one more year, The interest for next year will also be \(₹ 600\). Thus, Sunita will pay \(2 \times 600=₹ 1200\) interest for 2 years.

For ₹ 100 borrowed for 3 years at \(18 \%\), the interest be paid at the end of 3 years will be \(18+18+18=3 \times 18=₹ 54\)

As the number of year increase the interest also increases. This interest being charged unformly for each year is called simple interest.

In general, for Principal \(=P\), Rate of Interest \(=R\) and Time \(=T\) years.
Interest to be paid \((\mathrm{I})=\mathrm{P} \times \mathrm{R} \% \times \mathrm{T}\) or \(\mathrm{P} \times \frac{\mathrm{R}}{100} \times \mathrm{T}=\frac{\mathrm{PRT}}{100}=\frac{\mathrm{PTR}}{100}\)

\section*{Do This}
1. Find the interest on a sum of \(₹ 8250\) for 3 years at the rate of \(8 \%\) per annum.
2. ₹ 3000 is lent out at \(9 \%\) rate of interest. Find the interest which will be recieved at the end of \(21 / 2\) years.

Example 21 : In what time will ₹ 6880 amount to ₹ 7224 , if simple interest is calculated at \(10 \%\) per annum?
Solution: Amount =₹7224
Principal \(=\) ₹ 6880
S.I \(=\) Amount - Principal \(=₹ 7224-₹ 6880=₹ 344\)
\(\mathrm{R} \%=10 \%\)
\(\mathrm{I}=\mathrm{P} \times \frac{\mathrm{R}}{100} \times \mathrm{T}\)
\(344=6880 \times \frac{10}{100} \times \mathrm{T}\)
\(344 \times 100=6880 \times 10 \times T\)
Therefore, \(\mathrm{T}=\frac{344 \times 100}{6880 \times 10}=\frac{1}{2}\) year \(=6\) months

Example 22: What sum will yield an interest of ₹ 3927 in 2 years and 4 months at \(8 \%\) per annum?
Solution: \(\quad\) S.I \(=₹ 3927\)
\(R=8 \%\)
\(\mathrm{T}=2\) years +4 months \(=\left(2+\frac{4}{12}\right)=\left(2+\frac{1}{3}\right)=\frac{7}{3}\) years
Substituting in \(\mathrm{I}=\mathrm{P} \times \frac{\mathrm{R}}{100} \times \mathrm{T}\)
\(3927=\mathrm{P} \times \frac{8}{100} \times \frac{7}{3}\)
\(3927 \times 100 \times 3=\mathrm{P} \times 8 \times 7\)

Therefore, \(\mathrm{P}=\frac{3927 \times 100 \times 3}{8 \times 7}\)
Thus, \(\mathrm{P}=₹ 21037.50\)
Therefore, Principle \(=₹ 21037.50\)

Example 23: At what rate per annum will ₹ 6360 yield an interest of ₹ 1378 in \(2 \frac{1}{2}\) years?

Solution: \(\quad \operatorname{Principal}(\mathrm{P})=₹ 6360\)
Time \((T)=2 \frac{1}{2}\) years \(=\frac{5}{2}\) years

Simple interest (S.I) \(=₹ 1378\)
Substituting in \(\mathrm{I}=\mathrm{P} \times \frac{\mathrm{R}}{100} \times \mathrm{T}\)
\(1378=6360 \times \frac{\mathrm{R}}{100} \times \frac{5}{2}\)
\(1378 \times 100 \times 2=6360 \times 5 \times R\)
Therefore, \(R=\frac{1378 \times 100 \times 2}{6360 \times 5}=\frac{26}{3}=8 \frac{2}{3} \%\)

Example 24: At what rate per annum will the principal triples in 16 years?
Solution: Let the principal be ₹ \(x\)
\(\square\)
Amount after 16 years \(=₹ 3 x\)
Amount - Principal \(=\) Interest
Therefore, \(3 x-x=2 x\)
For \(\mathrm{P}=x, \quad \mathrm{~T}=16, \mathrm{I}=2 x\)
\[
\mathrm{I}=\mathrm{P} \times \frac{\mathrm{R}}{100} \times \mathrm{T}
\]
\[
\begin{aligned}
& 2 x=x \times \frac{\mathrm{R}}{100} \times 16 \\
& 2 x \times 100=x \times 16 \times \mathrm{R} \\
& \text { Therefore, } \mathrm{R}=\frac{2 x \times 100}{x \times 16}=\frac{25}{2}=12 \frac{1}{2} \%
\end{aligned}
\]

\section*{Exercise - 6.6}
1. How long will it take for a sum of ₹ 12600 invested at \(9 \%\) per annum become to ₹ 15624 ?
2. At what rate a sum doubles itself in 8 year 4 months?
3. A child friendly bank announces a savings scheme for school children. They will give kiddy banks to children. Children have to keep their savings in it and the bank collects all the money once in a year. To encourage children savings, they give 6\% interest if the amount exceeds by ₹ 10000 , and other wise \(5 \%\). Find the interest received by a school if they deposit ₹ 9000 for one year.
4. A sum of money invested at \(8 \%\) per annum for simple interest amounts to ₹ 12122 in 2 years. What will it amount to in 2 year 8 months at \(9 \%\) rate of interest?
5. In 4 years, \(₹ 6500\) amount to \(₹ 8840\) at a certain rate of interest. In what time will \(₹ 1600\) amounts to ₹ 1816 at the same rate?

\section*{Let's earn Interest}

\section*{Children! Let us play a game on simple interest.}

5 members can play this game.
1. Take 3 bowls each labelled as \(\mathrm{P}, \mathrm{R}\) and T . Drop 5 pieces of paper in each bowl such that every paper is marked with a number.
\(\square\)
(Hint: All the numbers in bowl P must be multiples of 100 or 1000.

2. Pick out 3 pieces of papers, one from each of the bowls, one after another.
3. The number on the paper picked from bowl ' P ' relates to principal, number on the paper picked frombowl ' \(T\) ' relates to time, number on the paper picked from bowl ' R ' relates to rate of interest.
4. Now calculate interest and tell the values of I, P, T and R to every one.
5. If you say the right answer enter the interest amount in your account other wise put a 0 in your account.

Note: Repeat 2 or 3 rounds and note down the values in the table given below.
\begin{tabular}{|c|c|c|c|c|}
\hline \multicolumn{6}{|c|}{ Interest amount } \\
\hline Name & \(1^{\text {st }}\) round & \(2^{\text {nd }}\) round & \(3^{\text {rd }}\) round & Total \\
\hline & & & & \\
\hline
\end{tabular}

\section*{Looking Back}
- Many times in day-to-day life we compare quantities using ratios. For e.g., my income is ₹ 10000 and my friend's is ₹ 20000. Thus, my income is half of my friend's income or we
 can say that my friend's income is twice my income. The ratio of my income and my friends income is 1:2. and the ratio of my friend's income and my income is \(2: 1\).
- When two ratio's are equal they are said to be in a proportion. The idea of proportion helps us solve various problems in our daily life.
- If some increase (decrease) in one quantity leads increase (decrease) in other quantity, the quantities are said to be in direct proportion.
- Ratio's can be expressed in the form of percentages. The word 'percent' means per hundred or out of every hundred. The symbol for percentage is ' \(\%\) '. \(13 \%\) means 13 out of 100 .
\(13 \%=\frac{13}{100}=0.13\)
- Percentages are used in various situations like profit and loss, discount and simple interest etc.,

\section*{Fun with Fascinating Ratios}

The digits \(1,2,3, \ldots 9\) can be arranged to form two numbers whose ratio is \(1: 2\), as \(\frac{7329}{14658}=\frac{1}{2}=1: 2\). This is interesting itself.

But even more fascinating is the fact that the nine digits can also be arranged to form numbers whose ratio is \(1: 3,1: 4,1: 5,1: 6,1: 7,1: 8\) and 1:9. Enjoy by finding them.

\subsection*{7.0 Introduction}

Ravi is reading the sports section of a newspaper. There are two tables on the sports page of the newspaper.

Top 5 Batsmen in World Cup 2011
\begin{tabular}{|l|c|}
\hline Name of the Batsman & \begin{tabular}{c} 
Runs \\
scored
\end{tabular} \\
\hline T Dilshan (Sri Lanka) & 500 \\
\hline Sachin Tendulkar (India) & 482 \\
\hline K. Sangakkara (Sri Lanka) & 465 \\
\hline Jonadhan Trott (England) & 422 \\
\hline UTharanga (Sri Lanka) & 395 \\
\hline
\end{tabular}

Table - 1

Top 5 Bowlers in World Cup 2011
\begin{tabular}{|l|c|}
\hline Name of the Bowler & \begin{tabular}{c} 
Wickets \\
Taken
\end{tabular} \\
\hline Shahid Affridi (Pakistan) & 21 \\
\hline Zahir Khan (India) & 21 \\
\hline TG Southee (New Zealand) & 18 \\
\hline Robin Peterson ( South Africa) & 15 \\
\hline M. Muralitharan (Sri Lanka) & 15 \\
\hline
\end{tabular}

Table - 2

\section*{What do the two tables tell us?}

Table 1 tells us the names of batsmen who scored the most runs in the World Cup, 2011 as well as the number of runs they scored. This information can help in taking decisions or in drawing conclusions. For e.g. it can help the organisers of the World Cup in deciding whom to award the prize for the best batsman.

Table-2 tells us the names of bowlers who took the most wickets in the World Cup, 2011 as well as the number of wickets they took. This information can also help in taking decisions or in drawing conclusions. For e.g. it can help the organisers of the World Cup in deciding whom to award the prize for the best bowler.

Information which is in the form of numbers or words and helps in taking decisions or drawing conclusions is called data. The names of batsmen and the runs they scored as well as the names of bowlers and the number of wickets they took is data. Tables and graphs are the ways in which data is presented.

The numerical entries in the data are called 'Observations'.
Look at your school information board. Do you find any data tables there? Find out
who uses this data.

\subsection*{7.1 Organising data}

Details of seven students of class VII in a school are collected under the Javahar Bala Arogya Raksha Scheme.

Krishna noted the heights of the following students in his notebook as
Amala-125cm, Lekhya-133cm, Thabasum-121cm, Sudha-140cm, Vanaja-117cm, Lenin-129cm and Rajesh-132cm.

Another student Kumar wrote the same data in the form of a table and arranged the heights in ascending order.
\begin{tabular}{|l|l|}
\hline Name of the Student & Height (in cms) \\
\hline Vanaja & 117 \\
\hline Thabassum & 121 \\
\hline Amala & 125 \\
\hline Lenin & 129 \\
\hline Rajesh & 132 \\
\hline Lekhya & 133 \\
\hline Sudha & 140 \\
\hline
\end{tabular}

\section*{Now, let us answer these questions.}
(i) Who is the tallest amongst the students?
(ii) Who is the shortest amongst the students?
(iii) Whose height is between that of Amala and Rajesh?

Did you use the data written by Krishna? or by Kumar? to answer the question. You must have used Kumar's data as it is organised and thus easier to read and understand.

\section*{Do This}

In a unit test Amar secured 20, 18, 23, 21, 24 and 22 marks in Telugu, Hindi, English, Mathematics, Science and Social Science respectively. Peter got 23, 21, 20, 19, 24 and 17 marks in the above subjects respectively. Interpret the data in an organized manner.

\section*{Classroom Project}

Use the weighing machine to find the weights of all your classmates. Organise this data in the form a table. Make sure to arrange the weights in either ascending or descending order. Then answer the following questions:
a. Who is the lightest student in your class?
b. How many students weigh more than 25 kg ?
c. How many students weigh between 20 and 30 kg ?

\subsection*{7.2 Representative Values}

In a hostel
- Average consumption of rice per child per day is 150 g .
- Average age of children is 13 years.
- Average height of children is 135 cm .

On studying this data, can we say that every child consumes exactly 150 gms of rice per day? Can we say that the age of each child in the class is 13 years? Can we say that the height
 of each child in class is 135 cm ? Obviously not, we know that some children may take more than 150 gms of rice some may take less and some may take exactly 150 gms . A similar situation will hold for children's weight and height.

At the same time, 150 gms gives us an idea of the amount of rice consumed by each child in the hostel. It is a representative value of the amount of rice consumed by each child. Similarly, 13 years gives us an idea of the age of each child in the hostel. It is a representative value of the age of each child. The same holds for the height. All the above examples are of a particular representative value called arithmetic mean. In the section ahead, we shall learn about 'arithmetic mean' and also two other types of representative values called 'median' and 'mode'.

\subsection*{7.3.1 Arithmetic Mean or Average}

The physical education teacher in a school instructed his students to practice regularly Rajender had his practice sessions for a week as follows.
\begin{tabular}{|l|c|c|c|c|c|c|c|}
\hline Day & Mon & Tue & Wed & Thu & Fri & Sat & Sun \\
\hline Minutes & 20 & 35 & 40 & 30 & 25 & 45 & 15 \\
\hline
\end{tabular}

Can we compute the time spent by Rajender for practice in terms of time spent per day? Let us observe.

What is the total time Rajender spent during the week on practice?
Total time \(=20+35+40+30+25+45+15=210\) minutes
Now to find the time spent on practice, per day, we divide the total time spent by the number of days.
i.e. \(\frac{20+35+40+30+25+45+15}{7}=\frac{210}{7}=30\) minutes

This is the average time spent on practice per day or the average practice session per day.

Example 1: Earnings (in rupees) of a vegetable vendor in a week are ` 200, ` 150, ` 180 , \(` 300, ` 160, ` 170\) and ` 170 . Find his average earning, per day.

Solution: \(\quad \begin{aligned} \text { Total earnings (in rupees) } & =200+150+180+300+160+170+170 \\ & =` 1330 \\ \text { Number of days } & =7\end{aligned}\)

Average earning or mean earning \(=\frac{1330}{7}=` 190\)

\section*{The average of a data is also called Arithmetic Mean or Mean.}

Average or Mean or Arithmetic Mean (A.M) \(=\frac{\text { Sum of all observations }}{\text { Number of observations }}\)

\section*{Try This}
1. The ages (in years) of players are in a team of \(16,16,16,14,17,18\). Then find the following:
(i) Age of the youngest and the oldest player.
(ii) Mean age of the players.

What is the average number of glasses of water that you drink per day? in a week. How did you find the average?

\subsection*{7.3.2 Where does the mean lie?}

The marks obtained by Anil, Amar, Anthony and Inder in Telugu, Hindi and English are given below.
\begin{tabular}{|l|c|c|c|}
\hline & Telugu & Hindi & English \\
\hline Anil & 15 & 8 & 10 \\
\hline Amar & 10 & 10 & 12 \\
\hline Antony & 11 & 6 & 11 \\
\hline Inder & 12 & 12 & 13 \\
\hline
\end{tabular}

Now let us calculate the average marks obtained by the students in each subject.
\begin{tabular}{|l|c|c|}
\hline \multicolumn{1}{|c|}{ Telugu } & \multicolumn{1}{c|}{ Hindi } & \multicolumn{1}{c|}{ English } \\
\hline\(A M=\frac{15+10+11+12}{4}\) & \(A M=\frac{8+10+6+12}{4}\) & \(A M=\ldots \ldots \ldots\) \\
\hline\(=\frac{48}{4}\) & \(=\frac{36}{4}\) & \(=\ldots \ldots \ldots\) \\
\hline\(=12\) & \(=\ldots \ldots \ldots\) & \(=\ldots \ldots .\). \\
\hline Highest marks \(=15\) & Highest marks \(=\ldots \ldots\). & Highest marks \(=\ldots \ldots\). \\
\hline Least marks \(=10\) & Least marks \(=\ldots \ldots\). & Least marks \(=\ldots \ldots\). \\
\hline Mean \(=12\) & Mean \(\quad=\ldots \ldots\). & Mean \(=\ldots \ldots\). \\
\hline
\end{tabular}

In the above each context, does the mean lie between the minimum and the maximum value?
You will find this is true.
The arithmetic mean always lies between the highest and lowest observations of the data.

\subsection*{7.3.3 A property of mean}

Example 2: In a family, ages (in years) of members; Krishna, Radhika, Niharika and Nikhil are \(44,39,17\) and 12. (i) Find the arithmetic mean of their ages. (ii) What were their ages 5 years before? Find their mean age. (iii) Can you see a relationship between the change in mean and the number of years.
Solution: Present ages of family members are \(=44,39,17,12\) years
Number of family members \(=4\)
(i) Therefore, Arithmetic Mean oftheir ages \(=\frac{44+39+17+12}{4}=\frac{112}{4}=28\) years
(ii) Ages of family members, 5 years ago \(=44-5,39-5,17-5,12-5\)
\[
=39,34,12,7
\]
\(\therefore\) Mean of their ages 5 years ago
\[
=\frac{39+34+12+7}{4}=\frac{92}{4}=23 \text { years }
\]
(iii) Thus, on reducing the age of each family member by 5 years, we find that the mean age of the family also decreases by 5 years from the present mean age.

Now calculate the mean age of the family, 3 years from now. What do you think will be the mean age of the family 10 years from now?

You will find that when all the values of data set are increased or decreased by a certain number, the mean also increases or decreases by the same number. \(\stackrel{\substack{\text { ald }}}{ }\) Try This
1. A data of 10 observations has a minimum value 15 and maximum value 25 . What is the possible mean of the data? Why?
(a) 12
(b) 15
(c) 21
(d) 27
2. Observations of a data are \(28,45,33,21,48,30,34,36\) and 40 . Without actual calculation choose the mean of the data.
(a) 20
(b) 35
(c) 48
(d) 50

\section*{Exercise - 7.1}
1. Maximum day time temperatures of Hyderabad in a week (from \(26^{\text {th }}\) February to \(4^{\text {th }}\) March, 2011) are recorded as \(26^{\circ} \mathrm{C}, 27^{\circ} \mathrm{C}, 30^{\circ} \mathrm{C}, 30^{\circ} \mathrm{C}, 32^{\circ} \mathrm{C}, 33^{\circ} \mathrm{C}\) and \(32^{\circ} \mathrm{C}\).
(i) What is the maximum temperature of the week?
(ii) What is the average temperatures of the week?
2. Rice consumed in a school under the mid-day meal program for 5 consecutive days is \(15.750 \mathrm{~kg}, 14.850 \mathrm{~kg}, 16.500 \mathrm{~kg}, 14.700\) kg , and 17.700 kg . Find the average rice consumption for the 5 days.

3. In a village three different crops are cultivated in four successive years. The profit (in rupees) on the crops, per acre is shown in the table below-
\begin{tabular}{|l|c|c|c|c|}
\hline Crop Year & 2005 & 2006 & 2007 & 2008 \\
\hline Ground nuts & 7000 & 8000 & 7500 & 7500 \\
\hline Jawar & 6000 & 1000 & 8000 & 1000 \\
\hline Millets & 9000 & 5000 & 3000 & 4000 \\
\hline
\end{tabular}
(i) Calculate the mean profit for each crop over the 4 years.
(ii) Based on your answers, which crop should be cultivated in the next year?
4. The number of passengers who travelled in TSSRTC bus from Adilabad to Nirmal in 4 trips in a day are \(39,30,45\) and 54 . What is the occupancy ratio (average number of passengers travelling per trip) of the bus for the day?

5. The following table shows the marks scored by Anju, Neelesh and Lekhya in four unit tests of English.
\begin{tabular}{|l|l|l|l|l|}
\hline Name of the Student & Unit Test I & Unit Test II & Unit Test III & Unit Test IV \\
\hline Anju & Absent & 19 & 23 & 21 \\
\hline Neelesh & 0 & 20 & 22 & 24 \\
\hline Lekhya & 20 & 24 & 24 & 24 \\
\hline
\end{tabular}
(i) Find the average marks obtained by Lekhya.
(ii) Find the average marks secured by Anju. Will you divide the total marks by 3 or 4? Why?
(iii) Neelesh has given all four tests. Find the average marks secured by him. Will you divide the total marks by 3 or 4 ? Why?
(iv) Who performed best in the English?
6. Three friends went to a hotel and had breakfast to their taste, paying ` \(16, ` 17\) and ` 21 respectively (i) Find their mean expenditure.(ii) If they have spent 3 times the amount that they have already spent, what would their mean expenditure be? (iii) If the hotel manager offers \(50 \%\) discount, what would their mean expenditure be? (iv) Do you notice any relationship between the change in expenditure and the change in mean expenditure.
7. Find the mean of the first ten natural numbers.
8. Find the mean of the first five prime numbers.
9. In a set of four integers, the average of the two smallest integers is 102 , the average of the three smallest integers is 103 , the average of all four is 104 . Which is the greatest of these integers?
10. Write at least two questions to find the mean, giving suitable data.

\section*{Project Work}

Find out the number of family members in the houses on your street. Calculate the average family size of your street.

\subsection*{7.4 Mode}

The second type of representative value that we will learn about is mode. Let us read the example given below.

Example 3: A shop keeper wants to find out which cooking oil he should stock in more number. For this, he maintains a record of cooking oil sale for the week in the form of the table given below.
\begin{tabular}{|l|l|}
\hline Day & Packets of oil sold \\
\hline Mon & GGGSSSSPP \\
\hline Tue & GGGSSSSSPP \\
\hline Wed & GGSSSSSP \\
\hline Thu & GGGSSSP \\
\hline Fri & GGGSSPP \\
\hline Sat & GSSSSSSSS \\
\hline Sun & GGGSSSP \\
\hline
\end{tabular}

\(\mathrm{G}=\) Ground nut oil packet, \(\mathrm{S}=\) Sunflower oil packet, and \(\mathrm{P}=\) Palmolein oil packet.

In such a situation will calculating the mean number of oil packets sold help the shopkeeper to take a decision?

Solution : The shopkeeper first calculates the average number of packets that he can order.
\[
\text { Average number of packets }=\frac{18+30+9}{3}=\frac{57}{3}=19 .
\]

Should the shopkeeper stock 19 packets for each type of oil? The shopkeeper looked at his sales figures again. He finds sunflower oil to be the most frequently demanded oil and palmolein oil to be the least demanded oil. If he was to order 19 packets of each he would fall short of sunflower oil and palmolein oil would be in surplus. The shopkeeper decides to stock more packets of sunflower oil and lesser number of packets of palmolein oil. Thus, the number of packets of sunflower oil i.e. 30 is the representative value for the shopkeeper's data as it tells him the most frequently purchased oil. So, this is mode.

The most frequently occurring value for a set of observations is called the mode.

The longest bar in a bar graph represents the mode, as can be seen in the bar graph given in the next page.

Example 4: Find the mode of the given set of numbers- 2,3,5,3,4,7,3,2,1,7,3
Solution : Arranging the numbers with same value together, we get 1,2,2,3,3,3,3,4,5,7,7
3 occurs more frequently than the other observations.
Thus, Mode \(=3\)

Example 5: Find the mode of the data 3, 5, 9, 6, 5, 9, 2, 9, 3, 5.
Solution: Arranging the numbers with the same value together we get \(2,3,3,5,5,5,6,9\), 9, 9.

Here both 5 and 9 occurs more and equal number of times i.e., 3 times.
Thus, the given data contains two modes, i.e., 5 and 9
This kind of data is called 'Bimodal Data.'
Note: If each observation in a data set is repeated an equal number of times then the data set has no mode.

\section*{Try This}
1. Find the modes of the following data.
(i) \(5,6,3,5,4,9,5,6,4,9,5\)
(ii) \(25,14,18,15,17,16,19,13,12,24\)
(iii) \(10,15,20,15,20,10,15,20,10\)

Example 6: Following are the marks obtained by 50 students in a unit test, which is administered for 10 marks. Find the mode of the data.
\begin{tabular}{|c|c|}
\hline Marks obtained & No. of students \\
\hline 00 & 2 \\
\hline 1 & 1 \\
\hline 2 & 2 \\
\hline 3 & 1 \\
\hline 4 & - \\
\hline 5 & 4 \\
\hline 6 & 10 \\
\hline 7 & 15 \\
\hline 8 & 9 \\
\hline 9 & 5 \\
\hline 10 & 1 \\
\hline Total & 50 \\
\hline
\end{tabular}

Solution: In the data marks are observations. From the data table it is clear that 7 marks are obtained by many students.

Mode of the data is 7
Note: The observation 7 that repeats fifteen times is the mode and number of times i.e. 15 should not be confused as the mode.

Example 7 : In which of the following situations, is the mode an appropriate representative value?
(a) A shopkeeper selling shirts, needs to decide which size of shirts to order more.
(b) For purchasing rice for a party of 20 people.
(c) For finding the height of the door in your house.

Solution : (a) Let us look at the first situation. Supposing the shopkeeper is selling 4 sizes of shirts and his sale for the month of February is-
\begin{tabular}{|c|c|}
\hline Shirt Size & Number \\
\hline M & 15 \\
\hline L & 18 \\
\hline XL & 40 \\
\hline XXL & 22 \\
\hline Total & 92 \\
\hline
\end{tabular}

The average number of shirts sold by the shopkeeper is \(\frac{12+18+40+22}{4}=23\) shirts.
In such a situation does it make sense for the shopkeeper to order 23 shirts of each size? The shopkeeper looks at his data again. He finds that the most frequently purchased size is XL, If he orders 23 shirts of each size, he will fall short of size XL shirts. He thus finds it more sensible to order more shirts of this size and lesser of the rest.

\section*{Thus, the shopkeeper uses mode or the most frequently occurring value to take his decision.}
(b) Look at second situation.

Neither we know how many take maximum and how much nor how many take minimum and how much. If we purchase 20 times of maximum, it would be waste, or if we purchase 20 times of munimum, it is not sufficient. So mode cann't be suggested here.
(c) Now look at third situation.

If there are 5 members in the house, and whose heights are \(134 \mathrm{~cm}, 125 \mathrm{~cm}, 100 \mathrm{~cm}, 125 \mathrm{~cm}\) and 144 cm , as mode of the data is 125 cm , we may suggest the height of the door must be 125 cm . But it is difficult for the person of height 144 cm . Evenif we take mean of their heights, it is difficult for tall persons. So neither the mode nor the mean can be used here.

\section*{Try This}
1. One situation where mean would be an appropriate representative value.
2. One situation where mode would be an appropriate representative value.

\section*{Exercise - 7.2}
1. Long jumps by 7 students of a team are \(98 \mathrm{~cm}, 125 \mathrm{~cm}, 140 \mathrm{~cm}, 155 \mathrm{~cm}, 174 \mathrm{~cm}, 140 \mathrm{~cm}\) and 155 cm . Find the mode of the data.
2. Ages of players in a cricket team are \(25,26,25,27,28,30,31,27,33,27,29\).
(i) Find the mean and mode of the data.(ii) Find the minimum number of players to be added to the above team so that mode of the data changes and what must be their ages.
3. Find the mode of the following data. 12, 24, 36, 46, 25, 38, 72, 36, 25, 38, 12, 24, 46, \(25,12,24,46,25,72,12,24,36,25,38\) and 36.
4. Decide whether mean or mode is a better representative value in the following situations.
(i) A shop keeper, who sells tooth paste tubes of different
 sizes, wants to decide which size is to be ordered more.
(ii) An invigilator wants to bring sufficient number of additional papers to the examination hall.
(iii) Preparation of the number of laddus for a marriage.
(iv) For finding the favorite cricketer in a class.

\subsection*{7.5 Median}

We have looked at situations where mean and mode are representative values of the data. Now let us look at another situation. The following are the salaries (in rupees) earned by the manager and the workers in a production unit.

Worker 3 - 4,000
\begin{tabular}{lll} 
Worker 4 & - & 4,200 \\
Worker 5 & - & \\
Worker 6 & - & \(\checkmark\) \\
3,500 \\
Worker 7 & - & \(\checkmark\) \\
\hline
\end{tabular}
Worker 8 - - 4,300

Worker 9 - ` 3,500
Worker 10 - ` 3,500
Will the mean salary or the mode of salaries be a representative value for this data?
Let us calculate the mean salary in the production unit.
\[
\begin{aligned}
\text { Mean salary } & =\frac{\text { Total salary }}{\text { Number of employees }} \\
& =\frac{3300+5000+4000+4200+3500+4500+4200+4300+3500+3500+40000}{11} \\
& =` 7272.72
\end{aligned}
\]

Is this salary a representative of the salaries of either the manager or the workers? No it is not. It is much lesser than the manager's salary and more than the salary of all the workers.

Now let us consider the mode. 3500 is the most frequently occurring value in the data. However, it occurs only thrice thus, cannot be a representative of the data.

Now, let us use another way of calculating the representative value.
Let us arrange the numbers in ascending order-
\(3300,3500,3500,3500,4000,4200,4200,4300,4500,5000,40000\)
The middle value of this data is 4200 as it divides employees into 2 equal groups -5 are earning more than 4200 and 5 are earning less. This value is called Median and as you can see it provides a representative picture for all.

In the above example, the number of observations is 11 i.e. an odd number, thus the median divides the data into 2 equal groups.

Now what if the number of observations were even?
Let us the take the example of the production unit again. What if a new worker earning ` 4000 joined the production unit?

Arranging the numbers in ascending order we get-
\(3300,3500,3500,3500,4000,4000,4200,4200,4300,4500,5000,40000\)
Here both 4000 and 4200 lie in the middle of the data. Here the median will be calculated by finding the average of these two values. Thus, the median salary \(=\frac{4000+4200}{2}={ }^{`} .4100\).

Example 8: The monthly incomes of 7 graduates is ` \(8000, ` 9000\), ` \(8200, ` 7900, ` 8500\), 8600 and \(\begin{gathered} \\ 60000\end{gathered}\). Find the median income.

Solution: Arranging the incomes in ascending order we get : 7900, 8000, 8200, 8500, 8600, 9000, 60000
Number of observations \(\quad=7 \quad\)\begin{tabular}{ll} 
Middle term, i.e., \(4^{\text {th }}\) term in the data & \(=8500\) \\
Thus, the median income & \(={ }^{\text { }} 8500\)
\end{tabular}

Example 9: Find the median of 49, 48, 15, 20, 28, 17, 14 and 110.
Solution : Ascending order of observations \(=14,15,17,20,28,48,49,110\)
Number of observations \(=8\)
Middle terms i.e. the \(4^{\text {th }}\) and \(5^{\text {th }}\) values are 20 and 28.
\[
\text { Median }=\text { Average of } 4^{\text {th }} \text { and } 5^{\text {th }} \text { values }=\frac{20+28}{2}=24
\]

Thus, median of the given data is 24

\section*{Exercise - 7.3}
1. Say true or false and why?
(i) The difference between the largest and smallest observations in a data set is called the mean.
(ii) In a bar graph, the bar which has greater length may contains mode.
(iii) Value ofeveryobservation in the data set is takeninto account when medianis calculated.
(iv) The median of a set of numbers is always one of the numbers
2. The monthly income (in rupees) of 7 households in a village are 1200, 1500, 1400, 1000, 1000, 1600, 10000. (i) Find the median income of the house holds. (ii) If one more household with monthly income of ` 1500 is added, what will the median income be?
3. Observations of a data are \(16,72,0,55,65,55,10\), and 41 . Chaitanya calculated the mode and median without taking the zero into consideration. Did Chaitanya do the right thing?
4. How many distinct sets of three positive integers have a mean of 6 , a median of 7 , and no mode?
5. Four integers are added to a group of integers \(3,4,5,5\) and 8 and the mean, median, and mode of the data increases by 1 each. What is the greatest integer in the new group of integers?

\section*{Play the Game}

Take a dice numbered \(1,2,3,4,5\) and 6 on its faces. Make a group of three students. Ask each student to roll the dice and record the number, turn by turn. Repeat the process for 10 rounds. Now each student will have 10 numbers each.
 Find the mean, median and mode of data of each student.

\subsection*{7.6 Presentation of data}

We have already learnt how to present data in bar graphs and pictographs in class 6. Pictographs represent data using pictures of objects. However, presenting data by a pictograph is often time consuming and difficult. Bar graphs help in presenting data with much more ease.

\subsection*{7.6.1 Bar Graph}

In this section we will learn a little more about bar graphs. We know that bar graphs are made up of bars of uniform width which can be drawn horizontally or vertically with equal spacing between them. The length of each bar tells us the frequency of the particular item. We also know that the length of the bar graph is as per scale.

Example 10: The bar graph shows the one day sales of various items in a shop.
(i) What are taken on \(x\)-axis and \(y\) axis?
(ii) What is the scale selected on the \(y\) axis?
(iii) Which of these provisions has most sale? How much?
(iv) Is the sale of onions more than red gram?
(v) What is the ratio between the sale

of jowar and the sale of red gram?

Example 11: Observe another bar graph.
(i) What information does the graph give us?
(ii) What are taken on \(x\)-axis and \(y\)-axis?
(iii) Which of these liquids has highest boiling point?
(iv) Which of these liquids has the lowest boiling point?
(v) What is the approximate ratio between the boiling point of mercury and the boiling point of ether?

\subsection*{7.6.2 Double Bar Graph}

Now let us learn about another type of bar graph
Example 12: Study the following graph representing the total enrolment of boys and girls in ZPP High School and answer the following questions.

Did you notice that there are two bars for each year? What does the first bar tell you? What does the second bar tell you? This kind of bar graph is called Double bar graph. It presents two observations side by side.
(i) In which year is the enrolment of girls more than the boys?
(ii) In which year is the enrolment of boys and girls the same?
(iii) In which year is the enrolment of girls minimum?
(iv) What is the total enrolment in the year 2007-08?

Example 13: The following are the marks in Maths and Science of five students in class VII.
Present this data in the form of a double bar graph.
\begin{tabular}{|l|r|c|}
\hline Name of Student & Maths & Science \\
\hline Saravan & 70 & 75 \\
\hline Raman & 35 & 30 \\
\hline Mani & 65 & 75 \\
\hline Renuka & 90 & 100 \\
\hline Girija & 22 & 35 \\
\hline Sharmila & 50 & 50 \\
\hline
\end{tabular}

Solution : Steps in drawing a double bar graph.
1. Draw \(x\)-axis (horizontal line) and \(y\)-axis (vertical line) on the graph paper and mark their intersection as O .
2. Take names of students on x -axis.
3. Take Maths and Science marks on \(y\)-axis,
4. Take an appropriate scale on \(y\)-axis so that maximum marks of both the subjects fit on the graph sheet. Here the maximum value to be plotted on Y - axis is 100 , so the scale \(1 \mathrm{~cm}=10\) marks, is appropriate.
5. Find the length of each bar by dividing the value by 10 (Scale is \(1 \mathrm{~cm}=10\) marks).
6. Draw bars representing 'Maths marks ' and 'Science marks' side by side of every student.

\subsection*{7.6.3 Pie Charts}

Another way in which data can be presented is through pie charts.
The monthly budget of a family is given in the table on the left. This data has been presented in a pie chart on the right. The higher the share of expenditure of perticular item of the total income, the more the area occupied by the item in the pie chart.
\begin{tabular}{|l|l|}
\hline Budget head & Amount (`) \\
\hline Food & 1500 \\
\hline Education & 750 \\
\hline Others & 2250 \\
\hline Savings & 4500 \\
\hline Total income & 9000 \\
\hline
\end{tabular}

Looking at the pie chart answer the following questions.
(i) What is the shape of the pie chart?
(ii) What is the name of each shape used to present different items in the pie chart?
(iii) Say true or false (a) The largest part of the income is saved.
(b) Least amount of money is spent on education.

\subsection*{7.6.4 Drawing a pie chart}

Now, let us learn about how data is presented on a pie chart.
The pie chart represents each item as a portion of the circle, as how much part of the total incomeis is shared by the particular item.

We know that the total angle at the centre of a circle is \(360^{\circ}\). We can assume that it represents the total of all observations i.e. ` 9000 .

Each item of expenditure is a part of the total income thus, the angle of the sector or the area of the sector will depend on the ratio between the item of expenditure and total income.
Thus, the angle of each sector \(=\frac{\text { Amount of Expenditure }}{\text { Total Income }} \times 360^{\circ}\)
We make below table to find the angle of the sectors.
\begin{tabular}{|l|l|l|l|}
\hline \begin{tabular}{l} 
Budget \\
head
\end{tabular} & \begin{tabular}{l} 
Amount of \\
expenditure
\end{tabular} & \begin{tabular}{l} 
Ratio between \\
expenditure and total income
\end{tabular} & \begin{tabular}{l} 
Angle of sector or \\
area of the sector
\end{tabular} \\
\hline Food & 1500 & \(\frac{1500}{9000}=\frac{1}{6}\) & \(\frac{1}{6} \times 360^{\circ}=60^{\circ}\) \\
\hline Education & 750 & \(\frac{750}{9000}=\frac{1}{12}\) & \(\frac{1}{12} \times 360^{\circ}=30^{\circ}\) \\
\hline Others & 2250 & \(\frac{2250}{9000}=\frac{1}{4}\) & \(\frac{1}{4} \times 360^{\circ}=90^{\circ}\) \\
\hline Savings & 4500 & \(\frac{4500}{9000}=\frac{1}{2}\) & \(\frac{1}{2} \times 360^{\circ}=180^{\circ}\) \\
\hline
\end{tabular}

Note: Check whether the sum of all the angles of the sectors equal to \(360^{\circ}\) ?

\section*{Steps of construction}
1. Draw a circle with any convenient radius and mark its centre ' \(O\) '.
2. Mark a point A , somewhere on the circumference and join OA .
3. Construct angle of the sector for food \(=60^{\circ}\). Draw \(\angle \mathrm{AOB}=60^{\circ}\).
4. Construct angle of the sector for education \(=30^{\circ}\). Draw \(\angle B O C=30^{\circ}\).
5. Construct angle of the sector for other \(=90^{\circ}\). Draw \(\angle \mathrm{COD}=90^{\circ}\).
6. Now \(\angle \mathrm{DOA}=180^{\circ}\) represents the angle sector for savings.

\section*{Exercise - 7.4}
1. Draw a bar graph for the following data.

Population of India in successive census years-
\begin{tabular}{|l|c|c|c|c|c|c|c|}
\hline Year & 1941 & 1951 & 1961 & 1971 & 1981 & 1991 & 2001 \\
\hline \begin{tabular}{l} 
Population \\
(in millions) (approx)
\end{tabular} & 320 & 360 & 440 & 550 & 680 & 850 & 1000 \\
\hline
\end{tabular}

Source: Data from census of India 1991 and 2001.
2. Draw a pie chart for the following data.
\begin{tabular}{|l|c|c|c|c|c|}
\hline Item of expenditure & Food & Health & Clothing & Education & Savings \\
\hline Amount spent in rupees & 3750 & 1875 & 1875 & 1200 & 7500 \\
\hline
\end{tabular}
3. Draw a double bar graph for the following data.

Birth and Death rates of different states in 1999.
\begin{tabular}{|l|c|c|}
\hline State & Birth Rate (Per 1000) & Death Rate (Per 1000) \\
\hline Andhra Pradesh & 22 & 8 \\
\hline Karnataka & 22 & 8 \\
\hline Tamil Nadu & 19 & 8 \\
\hline Kerala & 18 & 6 \\
\hline Maharashtra & 21 & 8 \\
\hline Orissa & 24 & 11 \\
\hline
\end{tabular}

Source : The table is taken from vittal statistics SRS 1999.
4. Draw a pie chart for the following data.

Time spent by a child during a day-
\begin{tabular}{|l|c|c|c|c|}
\hline Time spent for & Sleep & School & Play & Others \\
\hline Time spent & 8 hrs & 6 hrs & 2 hrs & 8 hrs \\
\hline
\end{tabular}
5. The adjoining pie chart gives the expenditure on various items during a month for a family. (The numbers written around the pie chart tell us the angles made by each sector at the centre.)

Answer the following.

(i) On which item is the expenditure minimum?
(ii) On which item is the expenditure maximum?
(iii) If the monthly income of the family is ` 9000 , what is the expenditure on rent?
(iv) If the expenditure on food is ` 3000 , what is the expenditure on education of children?

\section*{Project Work}
1. Gather information of the number of different kinds of houses in your locality (ward / colony / village). Then find mode.
2. Collect the item-wise expenditure of your family in a month and represent it as a pie chart.
3. Collect different data presented in the form of bar graphs and pie charts in magazines, newspapers etc. and present them on your school bulletin board.
4. Collect daily attendance of your class for a week and find its average.

\section*{Looking back}
- Mean, mode and median are representative values for a data set.
- Arithmetic mean or mean is equal to sum of all the
 observations of a data set divided by the number of observations. It lies between the lowest and highest values of the data.
- An observation of data that occurs most frequently is called the mode of the data. Adata set may have one or more modes and sometimes none.
- Median is simply the middle observation, when all observations are arranged in ascending or descending order. (In case of even number of observations meadian is the average of middle two observations.)
- A pie chart is a circular chart /graph divided into sectors, and is used to present data.
- The central angle of each sector (and consequently its area) in a pie chart, is proportional to the quantity that it represents.

Dr.C.R.Rao (India)
1920 AD
\(\mathcal{A}\) well known Statistician, famous for his "The ory of Estimation" (1945). He worked on Cramer-Rao Inequality and Fisher-Rao theorm.

Chapter

\subsection*{8.0 Introduction}

If we take a pile of one rupee coins and place them one on top of the other, they would match perfectly. Do you know why this happens? This is because all the coins have the same size and shape. In the same way papers of a blank note book have the same size and shape.

Look around you and find some examples of objects that share this kind of similarity i.e. they are identical in shape and size. Think of at least 5 such examples.

When we talk about objects of the same size and shape we say that the objects are congruent. A practical test of congruence is to place one object over the other and see if they superimpose exactly.

Are all ten rupee notes congruent? How will you check?

Similarly, check whether to 5 rupee notes are congruent. Write your observations.

We see many examples of congruent objects all around us. Now, think of some shapes that are congruent.

\section*{Do This}
1. Here are some shapes. See whether all the shapes given in a row are congruent to each other or not. You can trace the figures and check.
(i)

(ii)

(iii)

2. Which of the following pairs of figures are congruent?

(iii)

(v)

(ii)

(iv)

(vi)

\subsection*{8.1 Congruency of line segments}

Observe the two pairs of line segments given below.

Figure 1

Figure 2

Copy the line segment \(A B\) on a tracing paper. Place it on \(C D\). You will find that \(A B\) covers CD . Hence the line segments are congruent. We write \(\overline{\mathrm{AB}} \cong \overline{\mathrm{CD}}\) (Congruency is denoted by \(\cong\) ).

Repeat this activity for the pair of line segments in Figure 2. What do you find? Are they congruent?

You will notice that the pair of line segments in Figure 1 match with each other because they have same length and this is not the case in Figure 2.

The line segment has only one dimension i.e., length. So if two line segments have the same length, they are congruent. Conversely, if two line segments are congruent, they have the same length.

When we write \(\mathrm{AB}=\mathrm{CD}\), what we actually mean is \(\overline{\mathrm{AB}} \cong \overline{\mathrm{CD}}\).

\subsection*{8.2 Congruency of triangles}

We learnt that two line segments are congruent when their lengths are equal. We extend this idea to triangles. Two triangles are congruent if they are copies of one another and when superimposed, they cover each other exactly.

\(\triangle A B C\) and \(\triangle E F G\) cover each other exactly i.e. they are of the same size and shape. They are congruent triangles. We express congruency of the two triangles as \(\triangle \mathrm{ABC} \cong \triangle \mathrm{EFG}\).

If two triangles are congruent then all the corresponding parts of the two triangles are i.e. the three angles and three sides are congruent. We also say that if the corresponding parts of two triangles are congruent, then the triangles are congruent. This means that, when you place \(\triangle \mathrm{ABC}\) on \(\triangle \mathrm{EFG}\), their corresponding corners coincides with each other. A lies on \(\mathrm{E}, \mathrm{B}\) lies on F and C lies on G . Also \(\angle \mathrm{A}\) coincides with \(\angle \mathrm{E}, \angle \mathrm{B}\) coincides with \(\angle \mathrm{F}\) and \(\angle \mathrm{C}\) coincides with \(\angle \mathrm{G}\) and lastly AB coincides with EF, BC coincides with FG and AC coincides with EG.

Thus, for two triangles that are congruent, their corresponding parts i.e. vertices, angles and sides match one another or are equal.

In \(\triangle \mathrm{ABC}\) and \(\triangle \mathrm{EFG}\)
\(\mathrm{A} \rightarrow \mathrm{E}\)
\(\mathrm{B} \rightarrow \mathrm{F}\)
\(\mathrm{C} \rightarrow \mathrm{G}\)
(corresponding vertices)
\(\angle \mathrm{A} \cong \angle \mathrm{E} \quad \angle \mathrm{B} \cong \angle \mathrm{F}\)
\(\angle \mathrm{C} \cong \angle \mathrm{G}\)
(corresponding angles)
\(\overline{\mathrm{AB}} \cong \overline{\mathrm{EF}}\)
\(\overline{\mathrm{BC}} \cong \overline{\mathrm{FG}}\)
\(\overline{\mathrm{AC}} \cong \overline{\mathrm{EG}}\)
(corresponding sides)

So, when we say that \(\triangle \mathrm{ABC} \cong \triangle \mathrm{EFG}\). The order of the alphabet in the names of congruent triangles displays the corresponding relationships.

\section*{Do This}
1. \(\Delta \mathrm{EFG} \cong \Delta \mathrm{LMN}\)

Write the corresponding vertices, angles and sides of the two triangles.
2. If \(\triangle \mathrm{ABC} \cong \triangle \mathrm{DEF}\), then write the given below parts of \(\triangle \mathrm{ABC}\) that corresponds to \(\triangle \mathrm{DEF}\)
(i) DE
(ii) \(\angle \mathrm{E}\)
(iii) DF
(iv) EF
(v) \(\angle \mathrm{F}\)
3. Name the congruent triangles in each of the following pairs. Write the statement using ' \(\cong\) ’.

4. Name the congruent angles and sides for each pair of congruent triangles given below.
1. \(\Delta \mathrm{TUV} \cong \triangle \mathrm{XYZ}\)
2. \(\Delta \mathrm{CDG} \cong \Delta \mathrm{RSW}\)

\subsection*{8.3 Criterion for congruency of triangles}

Is it necessary for congruency to check whether all the corresponding parts of two triangles are congruent? How can we check if the given triangles are congruent using a minimum number of parts? Let us explore and find out.

\subsection*{8.3.1 Side-Side-Side congruency (SSS)}

Will all of you draw the same triangle if you only knew that the measure of one side of the triangle is 5 cm ? Kamal, Namrata and Sushma have drawn them like this.

Kamal

Namrata

Sushma

As you can see all the triangles are different. Kamal drew an equilateral triangle, Namrata drew a right-angled triangle and Sushma drew an obtuse-angled triangle.

Now can all of you draw the same triangle, if you knew the measures of only two sides of a triangle say, 4 cm and 5 cm . Again Kamal, Namrata and Sushma drew different triangles.

If three sides are given, say \(4 \mathrm{~cm}, 5 \mathrm{~cm}\) and 6 cm . Can you all of you draw same triangle? Yes. Kamal, Namrata and Sushma all drew the same triangle with the given sides.

Thus, if we want to draw a triangle congruent to \(\triangle \mathrm{ABC}\), the lengths of the three sides are sufficient. This is referred to as the Side-Side-Side(SSS) criterion for congruency of triangles.

If two triangles are congruent because the lengths of their corresponding sides are equal, then will their angles also be equal?

Side-Side-Side (SSS) criterion for congruence of triangles: If three sides of a triangle are equal to the corresponding three sides of another triangle, then the triangles are congruent.

\section*{Try This}

Measure the lengths of \(\triangle \mathrm{LMN}\). Now, construct a triangle with these measurements on a sheet of paper. Place this triangle over \(\triangle \mathrm{LMN}\). Are the triangles congruent? What criterion of congruency applies over here?

Example 1: Is \(\triangle \mathrm{PQR} \cong \triangle \mathrm{XYZ}\) ? Also, write the corresponding angles of the two triangles.

Solution : According to the given figure of \(\triangle \mathrm{PQR}\) and \(\triangle \mathrm{XYZ}\), we have
\[
\mathrm{PQ}=\mathrm{XY}=2.9 \mathrm{~cm}
\]
\(\mathrm{QR}=\mathrm{YZ}=6 \mathrm{~cm}\)
\(\mathrm{RP}=\mathrm{ZX}=5.3 \mathrm{~cm}\)
Therefore, by Side-Side-Side congruence criterion, \(\Delta \mathrm{PQR} \cong \triangle \mathrm{XYZ}\)
Clearly, the point P corresponds to point X , point Q corresponds to point Y and the point R corresponds to point Z .

So, \(\angle \mathrm{P}, \angle \mathrm{X} ; \angle \mathrm{Q}, \angle \mathrm{Y} ; \angle \mathrm{R}, \angle \mathrm{Z}\) are pairs of corresponding angles.

\section*{Exercise - 8.1}
1. Decide whether the SSS congruence is true with the following figures. Give reasons
(i)

(ii)

2. For the following congruent triangles, find the pairs of corresponding angles.
(i)

(ii)

3. In adjacent figure, choose the correct answer.
(i) \(\triangle \mathrm{PQR} \cong \triangle \mathrm{PQS}\)
(ii) \(\Delta \mathrm{PQR} \cong \Delta \mathrm{QPS}\)
(iii) \(\triangle \mathrm{PQR} \cong \triangle \mathrm{SQP}\)
(iv) \(\triangle \mathrm{PQR} \cong \triangle \mathrm{SPQ}\)

4. In the figure given below, \(\mathrm{AB}=\mathrm{DC}\) and \(\mathrm{AC}=\mathrm{DB}\). Is \(\triangle \mathrm{ABC} \cong \triangle \mathrm{DCB}\).

\subsection*{8.3.2 Side-Angle-Side Congruence (SAS)}

We have seen that it is not possible to draw congruent triangles, if we are given only the measurements of one side. Now, what if you were given one angle and one side? Kamal, Namrata and Sushma were told to draw triangles with one side equal to 5 cm and one angle equal to \(65^{\circ}\). They drew the following dissimilar triangles.

Kamal

Namrata

Sushma

Now, what if the three of them knew the two sides of the triangle and the angle included between these sides. The three children decided to draw triangles with sides 5 cm and 4.5 cm and the included angle of \(65^{\circ}\).

Kamal drew \(\triangle \mathrm{ABC}\). He drew BC as the base \(=5 \mathrm{~cm}\). He then made \(\angle \mathrm{C}=65^{\circ}\) using a protractor and then marked point A at a length of 4.5 cm on the angular line. He then joined points A and B .

Can you draw the \(65^{\circ}\) angle at point B with side \(\mathrm{AB}=4.5 \mathrm{~cm}\). Will the triangle that is formed be congruent to Kamal's triangle? Can you take the base to be 4.5 cm , side \(=5 \mathrm{~cm}\) and included angle \(=65^{\circ}\) ? Will the triangle that is formed be congruent to Kamal's triangle? You will find that the triangles formed in all these situations are congruent triangles.

Therefore, if we want to make a copy of \(\triangle \mathrm{ABC}\) or a triangle congruent to \(\triangle \mathrm{ABC}\), we need the lengths of the two sides and the measure of the angle between the two sides. This is referred to as the Side-Angle-Side(SAS) criterion for congruence of triangles.

Side-Angle-Side(SAS) criterion for congruence of triangles: If two sides and the angle included between the two sides of a triangle are congruent to the corresponding two sides and the included angle of another triangle, then the triangles are congruent.

\section*{Try This}

In \(\triangle \mathrm{PQR}\) measure the lengths PQ and QR as well as \(\angle \mathrm{Q}\). Now, construct a triangle with these three measurements on a sheet of paper. Place this triangle over \(\triangle \mathrm{PQR}\). Are the triangles congruent? What criterion of congruency applies over here?

Example 2: Observe the measurements of the triangles given below. Are the triangles congruent? Identify the corresponding vertices and angles in them.

Solution : \(\quad\) In \(\triangle \mathrm{ABC}\) and \(\triangle \mathrm{PQR}\),
\(\mathrm{AC}=\mathrm{QR}\) and \(\mathrm{BC}=\mathrm{PR}\) and included angle \(\angle \mathrm{C}=\angle \mathrm{R}\)
So, \(\triangle \mathrm{ABC} \cong \triangle \mathrm{QPR}\) (by SAS rule).
The correspondending parts are as follows:
\(\mathrm{A} \leftrightarrow \mathrm{Q}, \quad \mathrm{B} \leftrightarrow \mathrm{P} \quad\) and \(\quad \mathrm{C} \leftrightarrow \mathrm{R}\)
Therefore, \(\angle \mathrm{A}=\angle \mathrm{Q}, \quad \angle \mathrm{B}=\angle \mathrm{P} \quad\) and \(\quad \angle \mathrm{C}=\angle \mathrm{R}\)
Example 3: In \(\triangle \mathrm{PQR}, \mathrm{PQ}=\mathrm{PR}\) and PS is angle bisector of \(\angle \mathrm{P}\).
Are \(\triangle \mathrm{PQS}\) and \(\triangle \mathrm{PRS}\) congruent? If yes, give reasons.
Solution: In \(\triangle \mathrm{PQS}\) and \(\triangle \mathrm{PRS}\)
\(P Q=P R(\) given \()\)
\(\mathrm{PS}=\mathrm{PS}(\) common side \()\)
\(\angle \mathrm{QPS}=\angle \mathrm{RPS}\) (PS is the angle bisector)

Therefore, \(\triangle \mathrm{PQS} \cong \Delta \mathrm{PRS}\) (by SAS rule)

\section*{Exercise-8.2}
1. What additional information do you need to conclude that the two triangles given here under are congruent using SAS rule?

2. The map given below shows five different villages. Village \(M\) lies exactly halfway between the two pairs of villages \(A\) and \(B\) as well as and \(P\) and \(Q\). What is the distance between village \(A\) and village \(P\). (Hint: check if \(\triangle P A M \cong \Delta Q B M\) )

3. Look at the pairs of triangles given below. Are they congruent? If congruent write the corresponding parts.

(ii)

(iii)

(iv)

4. Which corresponding sides do we need to know to prove that the triangles are congruent using the SAS criterion?

\subsection*{8.3.3 Angle-Side-Angle congruency (ASA)}

Can the children construct a triangle if they know only one angle of the triangle? What if they know two angles? Will children be able to draw congruent triangles if they know all the angles of the triangle?

Kamal, Namrata and Sushma drew the following triangles of angles \(40^{\circ}, 60^{\circ}\) and \(80^{\circ}\).

Kamal

Namrata

Sushma

The angles of all the triangles are equal, whereas the lengths of their sides are not equal. So, they are not congruent.

Thus, we need to know the length of the sides to draw congruent triangles. What if we have two angles and one side? Kamal and Namrata drew the following triangles with angles \(60^{\circ}\) and
 \(40^{\circ}\) and side 5 cm . When both the children constructed their triangles they made the given side, the included side.
We can conclude that if we want to make a copy of a triangle or a triangle congruent to another triangle, then we need to know two angles and the length of the side included between the two angles. This is referred to as the Angle-Side-Angle criterion of congruence.

Angle-Side-Angle criterion of congruence: If two angles and the included side of a triangle are congruent to the two corresponding angles and included side of another triangle then the triangles are congruent.

Example 4: Two triangles \(\triangle \mathrm{CAB}\) and \(\triangle \mathrm{RPQ}\) are given below. Check whether the two are congruent? If they are congruent, what can you say about the measures of the remaining elements of the triangles.

Solution : In \(\triangle \mathrm{CAB}\) and \(\triangle \mathrm{RPQ}\),
\(\mathrm{BC}=\mathrm{QR}=4 \mathrm{~cm}\) (side) \(\angle \mathrm{B}=\angle \mathrm{Q}=120^{\circ}\) (included angle)
\(\mathrm{AB}=\mathrm{PQ}=3 \mathrm{~cm}\) (side)

Therefore, \(\triangle \mathrm{CAB} \cong \triangle \mathrm{RPQ}\) (SAS criterion of congruency)
Thus, in the two triangles
\(\mathrm{AC}=\mathrm{PR}\)
\(\angle \mathrm{C}=\angle \mathrm{R}\) and \(\angle \mathrm{A}=\angle \mathrm{P}\)
Example-5 : In the following figure, the equal angles in the two triangles are shown. Are the triangles congruent?

Solution: In \(\triangle \mathrm{ABD}\) and \(\triangle \mathrm{ACD}\)
\(\angle \mathrm{BAD}=\angle \mathrm{CAD}\) (given)
\(\angle \mathrm{ADB}=\angle \mathrm{ADC}\) (given)

\(\mathrm{AD}=\mathrm{AD}\) (common side)
Therefore, \(\triangle \mathrm{ABD}=\triangle \mathrm{ACD}\) (ASA criterion of congruency)

\section*{Try This}

Is the following pair of triangles congruent? Give reason to support your answer.

\section*{Exercise - 8.3}
1. In following pairs of triangles, find the pairs which are congruent? Also, write the criterion of congruence.
(i)

(ii)

2. In the adjacent figure.
(i) Are \(\triangle \mathrm{ABC}\) and \(\triangle \mathrm{DCB}\) congruent?
(ii) Are \(\triangle \mathrm{AOB}\) and \(\triangle \mathrm{DOC}\) congruent?

Identify the corresponding sides. Write the criterion of congruence.

\subsection*{8.3.4 Right-Angle Hypotenuse Side congruence (RHS criterion)}

In right-angled triangles we already know that one of the angles is a right angle. So what else do we need to prove that the two triangles are congruent?

Let us take the example of \(\Delta \mathrm{ABC}\) with \(\angle \mathrm{B}=90\). Can we draw a triangle congruent to this triangle, if,
(i) only BC is known
(ii) only \(\angle \mathrm{C}\) is known
(iii) \(\angle \mathrm{A}\) and \(\angle \mathrm{C}\) are known
(iv) AB and BC are known
(v) \(\quad \angle \mathrm{C}\) and BC are known

(vi) BC and the hypotenuse AC are known
(vii) When you try to draw the rough sketches of these triangles, you will find it is possible only in cases (iv), (v) and (vi).

The last of the situations is new to us and it is called the Right-Angle Hypotenuse Congruence Criterion.

\section*{Right-Angle Hypotenuse Congruence Criterion}

If the hypotenuse and one side of a right angled triangle are equal to the corresponding hypotenuse and side of the other right angled triangle, then the triangles are congruent.

Example 6: Given below are measurements of some parts of two triangles. Examine whether the two triangles are congruent or not, using RHS congurence rule. In case of congruent triangles, write the result in symbolic form:
\(\triangle \mathrm{ABC} \quad \triangle \mathrm{PQR}\)
(i) \(\angle \mathrm{B}=90^{\circ}, \mathrm{AC}=8 \mathrm{~cm}, \mathrm{AB}=3 \mathrm{~cm} \quad \angle \mathrm{P}=90^{\circ}, \mathrm{PR}=3 \mathrm{~cm}, \mathrm{QR}=8 \mathrm{~cm}\)
(ii) \(\angle \mathrm{A}=90^{\circ}, \mathrm{AC}=5 \mathrm{~cm}, \mathrm{BC}=9 \mathrm{~cm} \quad \angle \mathrm{Q}=90^{\circ}, \mathrm{PR}=8 \mathrm{~cm}, \mathrm{PQ}=5 \mathrm{~cm}\)

\section*{Solution :}
(i) Here, \(\angle \mathrm{B}=\angle \mathrm{P}=90^{\circ}\)
hypotenuse, \(\mathrm{AC}=\) hypotenuse, \(\mathrm{RQ}(=8 \mathrm{~cm})\)
side \(\mathrm{AB}=\) side \(\mathrm{RP}(=3 \mathrm{~cm})\)
So, \(\triangle A B C \cong \triangle R P Q\)
(By RHS Congruence rule).

Figure 1
(ii) Here, \(\angle \mathrm{A}=\angle \mathrm{Q}=90^{\circ}\) and side \(\mathrm{AC}=\) side \(\mathrm{PQ}(=5 \mathrm{~cm})\). hypotenuse, \(\mathrm{BC} \neq\) hypotenuse, PR So, the triangles are not congruent.

Figure 2

Example 7: In the adjacent figure, \(\overline{\mathrm{DA}} \perp \overline{\mathrm{AB}}, \overline{\mathrm{CB}} \perp \overline{\mathrm{AB}}\) and \(\mathrm{AC}=\mathrm{BD}\).

State the three pairs of equal parts in \(\triangle \mathrm{ABC}\) and
 \(\triangle \mathrm{DAB}\).

Which of the following statements are correct?
(i) \(\triangle \mathrm{ABC} \cong \triangle \mathrm{BAD}\)
(ii) \(\triangle \mathrm{ABC} \cong \triangle \mathrm{ABD}\)

\section*{Solution : The three pairs of equal parts are :}
\(\angle \mathrm{ABC}=\angle \mathrm{BAD}\left(=90^{\circ}\right)\)
\(\mathrm{AC}=\mathrm{BD}\) (Given)
\(\mathrm{AB}=\mathrm{BA}\) (Common side)
\(\Delta \mathrm{ABC} \cong \triangle \mathrm{BAD}\) (By RHS congruence rule).
Therefore, from the above,
statement (i) is true; and
statement (ii) is not correct, in the sense that the correspondence among the vertices is not staisfied.

\section*{Try This}
1. In the figures given below, measures of some parts of triangles are given. By applying RHS congruence rule, state which pairs of triangles are congruent. In case of congruent triangles, write the result in symbolic form.

(iii)

(ii)

(iv)
2. It is to be established by RHS congruence rule that \(\triangle \mathrm{ABC} \cong \triangle \mathrm{RPQ}\). What additional information is needed, if it is given that \(\angle \mathrm{B}=\angle \mathrm{P}=90^{\circ}\) and \(\mathrm{AB}=\mathrm{RP}\) ?
3. In the adjacent figure, \(B D\) and \(C E\) are altitudes of \(\triangle A B C\) such that \(\mathrm{BD}=\mathrm{CE}\).
(i) State the three pairs of equal parts in \(\triangle \mathrm{CBD}\) and \(\triangle B C E\).
(ii) Is \(\triangle \mathrm{CBD} \cong \triangle \mathrm{BCE}\) ? Give reasons.
(iii) Is \(\angle \mathrm{DBC}=\angle \mathrm{EBC}\) ? Why?
4. ABC is an isosceles triangle with \(\mathrm{AB}=\mathrm{AC}\) and AD is one of its altitudes (fig ...).
(i) State the three pairs of equal parts in \(\triangle \mathrm{ADB}\) and \(\triangle \mathrm{ADC}\).
(ii) Is \(\triangle \mathrm{ADB} \cong \triangle \mathrm{ADC}\) ? Why?

(iii) Is \(\angle \mathrm{B}=\angle \mathrm{C}\) ? Why?
(iv) \(\mathrm{Is} \mathrm{BD}=\mathrm{CD}\) ? Why?

\section*{Exercise - 8.4}
1. Which congruence criterion do you use in the following?
(i) Given : \(\mathrm{AC}=\mathrm{DF}\)
\(\mathrm{AB}=\mathrm{DE}\)
\(\mathrm{BC}=\mathrm{EF}\)

So, \(\triangle \mathrm{ABC} \cong \triangle \mathrm{DEF}(\mathrm{SSS})\)
(ii) Given: \(\mathrm{ZX}=\mathrm{RP}\)
\[
\mathrm{ZY}=\mathrm{RQ}
\]
\[
\angle \mathrm{XZY}=\angle \mathrm{PRQ}
\]

So,\(\triangle \mathrm{PQR} \cong \triangle \mathrm{XYZ}\) (SAS)

(iii) Given : \(\angle \mathrm{MLN} \cong \angle \mathrm{FGH}\)
\(\angle \mathrm{NML} \cong \angle \mathrm{GFH}\)
\(\mathrm{ML}=\mathrm{FG}\)
So, \(\Delta \mathrm{LMN} \cong \Delta \mathrm{GFH}(\mathrm{ASA})\)

(iv) Given: \(\mathrm{EB}=\mathrm{DB}\)
\[
\begin{aligned}
& \mathrm{AE}=\mathrm{BC} \\
& \angle \mathrm{~A}=\angle \mathrm{C}=90^{\circ}
\end{aligned}
\]

\section*{So, \(\triangle \mathrm{ABE} \cong \triangle \mathrm{CDB}\) (RHS)}

2. You want to show that \(\triangle \mathrm{ART} \cong \triangle \mathrm{PEN}\),
(i) If you have to use SSS criterion, then you need to show
(a) \(\mathrm{AR}=\)
(b) \(\mathrm{RT}=\)
(c) \(\mathrm{AT}=\)

(ii) If it is given that \(\angle \mathrm{T}=\angle \mathrm{N}\) and you are to use SAS criterion, you need to have
(a) \(\mathrm{RT}=\)
and
(ii) \(\mathrm{PN}=\)

(iii) If it is given that \(\mathrm{AT}=\mathrm{PN}\) and you are to use ASA criterion, you need to have
(a)?
(b) ?
3. To show \(\triangle \mathrm{AMP} \cong \triangle \mathrm{AMQ}\) in the following proof, state the missing reasons.
\begin{tabular}{|c|c|}
\hline Steps & Reasons \\
\hline (i) \(\mathrm{PM}=\mathrm{QM}\) & (i) ...... \\
\hline (ii) \(\angle \mathrm{PMA} \cong \angle \mathrm{QMA}\) & (ii) \\
\hline (iii) \(\mathrm{AM}=\mathrm{AM}\) & (iii) .... \\
\hline (iv) \(\triangle \mathrm{AMP} \cong \triangle \mathrm{AMQ}\) & (iv) ......... \\
\hline
\end{tabular}

4. In \(\triangle \mathrm{ABC}, \angle \mathrm{A}=30^{\circ}, \angle \mathrm{B}=40^{\circ}\) and \(\angle \mathrm{C}=110^{\circ}\)

In \(\triangle \mathrm{PQR}, \angle \mathrm{P}=30^{\circ}, \angle \mathrm{Q}=40^{\circ}\) and \(\angle \mathrm{R}=110^{\circ}\)
A student says that \(\triangle \mathrm{ABC} \cong \triangle \mathrm{PQR}\) by AAA congruence criterion. Is he justified? Give reasons.
5. In the adjacent figure, the two triangles are congruent. The corresponding parts are marked. \(\Delta \mathrm{RAT} \cong\) ?

6．Complete the congruence statement．

\(\Delta \mathrm{ABC} \cong ?\)

\(\Delta \mathrm{QRS} \cong ?\)

7．In a squared sheet，draw two triangles of equal areas such that
（i）the triangles are congruent．
（ii）the triangles are not congruent．
What can you say about their perimeters？

8．If \(\triangle \mathrm{ABC}\) and \(\triangle \mathrm{PQR}\) are to be congruent， name one additional pair of corresponding parts．What criterion did you use？

9．Is \(\triangle \mathrm{ABC} \cong \triangle \mathrm{FED}\) ？
Why？

\section*{Looking Back}

1．Congruent objects are objects having the same shape and size．
2．The method of superimposition examines the congruence of plane figures．

3．Two line segments say，\(\overline{\mathrm{AB}}\) and \(\overline{\mathrm{CD}}\) are congruent if they have equal lengths． We write this as \(\overline{\mathrm{AB}} \cong \overline{\mathrm{CD}}\) ．However，it is common to write it as \(\mathrm{AB}=\mathrm{CD}\) ．

4．If all the parts of one triangle are equal to the corresponding parts of other triangle，then the triangles are congruent．
5. The necessary and sufficient conditions for two triangles to be congruent are as follows:
(i) Side-Side-Side (SSS) criterion for congruence: If three sides of a triangle are equal to the corresponding three sides of another triangle, then the triangles are congruent.
(ii) Side-Angle-Side(SAS) criterion for congruence: If two sides and the angle included between the two sides of a triangle are equal to the corresponding two sides and the included angle of another triangle, then the triangles are congruent.
(iii) Angle-Side-Angle criterion of congruence: If two angles and the included side of a triangle are equal to the corresponding two angles and included side of another triangle then the triangles are congruent.
(iv) Right-Angle Hypotenuse criterion of congruence: If the hypotenuse and one side of a right-angled triangle are equal to the corresponding hypotenuse and side of the other right-angled triangle, then the triangles are congruent.

Chapter \(\because \cos ^{2}\)

\subsection*{9.0 Introduction}

You will learn how to construct triangles in this chapter. A triangle can be drawn if you know the elements that are required for two triangles to be congurent. Thus, a triangle can be drawn in any of the situations given below i.e., if we know the-
(i) Three sides of the triangle.
(ii) Two sides and the angle included between them.
(iii) Two angles and the side included between them.
(iv) Hypotenuse and one adjacent side of a right-angled triangle.

A triangle can also be drawn if two of its sides and a non-included angle are given. So, we require three independent measurements to construct a triangle.

Let us learn to construct triangles in each of the above cases.

\subsection*{9.1 Construction of a triangle when measurements of the three sides are given}

In the construction of any geometrical figure, drawing a rough sketch first, helps in indentifying the sides. So we should first draw a rough sketch of the triangle we want to construct and label it with the given measurements.

Example 1: Construct a \(\triangle \mathrm{PQR}\) with sides \(\mathrm{PQ}=4 \mathrm{~cm}, \mathrm{QR}=5 \mathrm{~cm}\) and \(\mathrm{RP}=7 \mathrm{~cm}\).
STEP 1: Draw a rough sketch of the triangle and label it with the given measurements.

STEP 2: Draw a line segment \(Q R\) of length 5 cm .

STEP 3: With centre Q , draw an arc of radius 4 cm .

STEP4: Since \(P\) is at a distance of 7 cm from
 R , draw another arc from R with radius 7 cm such that it intersects first arc. Mark the intersection point as \(P\).

STEP 5 : Join \(Q, P\) and \(P, R\). The required \(\triangle P Q R\) is constructed.

\section*{Exercise - 9.1}
1. Construct \(\triangle \mathrm{ABC}\) in which \(\mathrm{AB}=5.5 \mathrm{~cm}, \mathrm{BC}=6.5 \mathrm{~cm}\) and \(\mathrm{CA}=7.5 \mathrm{~cm}\).
2. Construct \(\Delta \mathrm{NIB}\) in which \(\mathrm{NI}=5.6 \mathrm{~cm}, \mathrm{IB}=6 \mathrm{~cm}\) and \(\mathrm{BN}=6 \mathrm{~cm}\). What type of triangle is this?
3. Construct an equilateral \(\Delta \mathrm{APE}\) with side 6.5 cm .
4. Construct a \(\triangle \mathrm{XYZ}\) in which \(\mathrm{XY}=6 \mathrm{~cm}, \mathrm{YZ}=8 \mathrm{~cm}\) and \(\mathrm{ZX}=10 \mathrm{~cm}\). Using protractor find the angle at X . What type of triangle is this?
5. Construct \(\triangle \mathrm{ABC}\) in which \(\mathrm{AB}=4 \mathrm{~cm}, \mathrm{BC}=7 \mathrm{~cm}\) and \(\mathrm{CA}=3 \mathrm{~cm}\). Which type of triangle is this?
6. Construct \(\triangle \mathrm{PEN}\) with \(\mathrm{PE}=4 \mathrm{~cm}, \mathrm{EN}=5 \mathrm{~cm}\) and \(\mathrm{NP}=3 \mathrm{~cm}\). If you draw circles instead of arcs how many points of intersection do you get? How many triangles with given measurements are possible? Is this true in case of every triangle?

\section*{Try This}

Sushanth prepared a problem: Construct \(\triangle X Y Z\) in which \(X Y=2 \mathrm{~cm}, Y Z=8 \mathrm{~cm}\) and \(\mathrm{XZ}=4 \mathrm{~cm}\).

He also drew the rough sketch as shown in Figure 1.

Reading the problem, Srija told Sushanth that it would not be possible to draw a triangle with the given measurements.

However, Sushanth started to draw the diagram as shown in Figure 2.

Check whether Sushanth can draw the triangle. If not why? Discuss with your friends.
What property of triangles supports Srija's idea?

\subsection*{9.2 Construction of a triangle with two given sides and the included angle.}

Example 2 : Construct \(\triangle \mathrm{ABC}\) in which \(\mathrm{AB}=4 \mathrm{~cm}, \mathrm{BC}=5 \mathrm{~cm}\) and \(\angle \mathrm{B}=50^{\circ}\).
STEP 1 : Draw a rough sketch of a triangle and label it with the given measurements.

STEP 2 : Draw a line segment \(A B\) of length 4 cm .

STEP 3 : Draw a ray \(\overrightarrow{\mathrm{BX}}\) making an angle \(50^{\circ}\) with AB .
(Use protractor from your geometry box to measure this angle.)

STEP 4: Draw an arc of radius 5 cm from \(B\), such that it intersects ray \(\overrightarrow{\mathrm{BX}}\). Mark the intersection point as C .

STEP 5: Join C, A to get the required \(\triangle \mathrm{ABC}\).

\section*{Exercise - 9.2}
1. Draw \(\triangle \mathrm{CAR}\) in which \(\mathrm{CA}=8 \mathrm{~cm}, \angle \mathrm{~A}=60^{\circ}\) and \(\mathrm{AR}=8 \mathrm{~cm}\). Measure \(\mathrm{CR}, \angle \mathrm{R}\) and \(\angle \mathrm{C}\). What kind of triangle is this?
2. Construct \(\triangle \mathrm{ABC}\) in which \(\mathrm{AB}=5 \mathrm{~cm}, \angle \mathrm{~B}=45^{\circ}\) and \(\mathrm{BC}=6 \mathrm{~cm}\).
3. Construct \(\triangle \mathrm{PQR}\) such that \(\angle \mathrm{R}=100^{\circ}, \mathrm{QR}=\mathrm{RP}=5.4 \mathrm{~cm}\).
4. Construct \(\triangle \mathrm{TEN}\) such that \(\mathrm{TE}=3 \mathrm{~cm}, \angle \mathrm{E}=90^{\circ}\) and \(\mathrm{NE}=4 \mathrm{~cm}\).

\subsection*{9.3 Construction of a triangle when two angles and the side between the angles is given}

Example 3 : Construct \(\triangle \mathrm{MAN}\) with \(\mathrm{MA}=4 \mathrm{~cm}, \angle \mathrm{M}=45^{\circ}\) and \(\angle \mathrm{A}=100^{\circ}\).

STEP 1 : Draw rough sketch of a triangle and label it with the given measurements.

STEP 2: Draw line segment MA of length 4 cm .

STEP3: Using protractor draw a ray \(\overrightarrow{\mathrm{MX}}\), making an angle \(45^{\circ}\) at M .

STEP 4 : Using protractor draw a ray \(\overrightarrow{\mathrm{AY}}\), making an angle \(100^{\circ}\) at A .

Extend the ray \(\overrightarrow{\mathrm{MX}}\) if necessary to intersect ray \(\overrightarrow{\mathrm{AY}}\).

STEP 5 : Mark the intersecting point of the two rays as \(N\). You have the required \(\triangle\) MAN

\section*{Try This}

Construct a triangle with angles \(105^{\circ}\) and \(95^{\circ}\) and a side of length of your choice. Could you construct the triangle? Discuss with your friends and justify.

\section*{Exercise - 9.3}
1. Construct \(\triangle \mathrm{NET}\) with measurement \(\mathrm{NE}=6.4 \mathrm{~cm}, \angle \mathrm{~N}=50^{\circ}\) and \(\angle \mathrm{E}=100^{\circ}\).
2. Construct \(\triangle \mathrm{PQR}\) such that \(\mathrm{QR}=6 \mathrm{~cm}, \angle \mathrm{Q}=\angle \mathrm{R}=60^{\circ}\). Measure the other two sides of the triangle and name the triangle.
3. Construct \(\triangle \mathrm{RUN}\) in which \(\mathrm{RN}=5 \mathrm{~cm}, \angle \mathrm{R}=\angle \mathrm{N}=45^{\circ}\). Measure the other angle

Example 4 : Construct \(\triangle \mathrm{ABC}\), right-angled at A , and \(\mathrm{BC}=6 \mathrm{~cm} ; \mathrm{AB}=5 \mathrm{~cm}\).
STEP 1 : Draw a rough sketch of right-angled triangle and label it with given information.

Note: side opposite to the right angle is called hypotenuse.

STEP 2 : Draw a line segment \(A B\) of length 5 cm .

STEP 3: Construct a ray \(\overrightarrow{\mathrm{AX}}\) perpendicular to AB at A .

STEP 4 : Draw an arc from \(B\) with radius 6 cm intersecting \(\overrightarrow{\mathrm{AX}}\). Mark the intersection point as ' C '.

STEP 5: Join B,C to get the required \(\triangle \mathrm{ABC}\).

\section*{Exercise - 9.4}
1. Construct a right-angled \(\triangle \mathrm{ABC}\) such that \(\angle \mathrm{B}=90^{\circ}, \mathrm{AB}=8 \mathrm{~cm}\) and \(\mathrm{AC}=10 \mathrm{~cm}\).
2. Construct a \(\triangle \mathrm{PQR}\), right-angled at R , hypotenuse is 5 cm and one of its adjacent sides is 4 cm .
3. Construct an isosceles right-angled \(\triangle \mathrm{XYZ}\) in which \(\angle \mathrm{Y}=90^{\circ}\) and the two sides are 5 cm each.
9.5 Construction of triangle when two sides and the non-included angle are given

Example 5: Construct \(\triangle \mathrm{ABC}\) such that \(\mathrm{AB}=5 \mathrm{~cm}, \mathrm{AC}=4 \mathrm{~cm}, \angle \mathrm{~B}=40^{\circ}\).

STEP 1: Draw rough sketch of \(\triangle \mathrm{ABC}\) and label it with the given measurements.

STEP 2: Draw a line segment \(A B\) of length 5 cm .

STEP 4 : With A as centre and radius 4 cm , draw an arc to cut ray \(\overrightarrow{\mathrm{BX}}\).

STEP 5: Mark the intersecting point as C and join C , A to get the required \(\triangle \mathrm{ABC}\).

Can you cut the ray \(\overrightarrow{\mathrm{BX}}\) at any other point? You will see that as \(\angle \mathrm{B}\) is acute, the \(\operatorname{arc}\) from A of radius 4 cm cuts the ray \(\overrightarrow{\mathrm{BX}}\) twice.

Let the intersecting points be named as C and \(\mathrm{C}^{1}\).

If we join C and A , we get one triangle and if we join \(\mathrm{C}^{1}\) and
 A, then we get other triangle. So we may have two triangles as given below:

\section*{Try This}

Construct a triangle with two sides of length of your choice and the non-included angle as an obtuse angle. Can you draw two triangles in this solution?

\section*{Exercise - 9.5}
1. Construct \(\triangle \mathrm{ABC}\) in which \(\mathrm{AB}=4.5 \mathrm{~cm}, \mathrm{AC}=4.5 \mathrm{~cm}\) and \(\angle \mathrm{B}=50^{\circ}\). Check whether you get two triangles.
2. Construct \(\triangle X Y Z\) such that \(X Y=4.5 \mathrm{~cm}, X Z=3.5 \mathrm{~cm}\) and \(\angle Y=70^{\circ}\). Check whether you get two triangles.
3. Construct \(\triangle\) ANR with the sides AN and AR of lengths 5 cm and 6 cm respectively and \(\angle \mathrm{N}\) is \(100^{\circ}\). Check whether you get two triangles.
4. Construct \(\triangle \mathrm{PQR}\) in which \(\mathrm{QR}=5.5 \mathrm{~cm}, \mathrm{QP}=5.5 \mathrm{~cm}\) and \(\angle \mathrm{Q}=60^{\circ}\). Measure RP . What kind of triangle is this?
5. Construct the triangles with the measurement given in the following table.
\begin{tabular}{|c|l|}
\hline Triangle & Measurements \\
\hline\(\Delta \mathrm{ABC}\) & \(\mathrm{BC}=6.5 \mathrm{~cm}, \mathrm{CA}=6.3 \mathrm{~cm}, \mathrm{AB}=4.8 \mathrm{~cm}\). \\
\hline\(\Delta \mathrm{PQR}\) & \(\mathrm{PQ}=8 \mathrm{~cm}, \mathrm{QR}=7.5 \mathrm{~cm}, \angle \mathrm{PQR}=85^{\circ}\) \\
\hline\(\Delta \mathrm{XYZ}\) & \(\mathrm{XY}=6.2 \mathrm{~cm}, \angle \mathrm{Y}=130^{\circ}, \angle \mathrm{Z}=70^{\circ}\) \\
\hline\(\Delta \mathrm{ABC}\) & \(\mathrm{AB}=4.8 \mathrm{~cm}, \mathrm{AC}=4.8 \mathrm{~cm}, \angle \mathrm{~B}=35^{\circ}\) \\
\hline\(\Delta \mathrm{MNP}\) & \(\angle \mathrm{N}=90^{\circ}, \mathrm{MP}=11.4 \mathrm{~cm} ., \mathrm{MN}=7.3 \mathrm{~cm}\). \\
\hline\(\Delta \mathrm{RKS}\) & \(\mathrm{RK}=\mathrm{KS}=\mathrm{SR}=6.6 \mathrm{~cm}\). \\
\hline\(\Delta \mathrm{PTR}\) & \(\angle \mathrm{P}=65^{\circ}, \mathrm{PT}=\mathrm{PR}=5.7 \mathrm{~cm}\). \\
\hline
\end{tabular}

\section*{Looking Back}

To construct a triangle, three independent measurements are required. A triangle can be constructed when.
(i) The three sides of the triangle are given.

(ii) Two sides and the angle included between them is given.
(iii) Two angles and their included side is given.
(iv) The hypotenuse and one adjacent side of a right angle triangle are given.
(v) Two sides and the not included angle are given.

\section*{Chapter \\ 10 \\  \\ }

\subsection*{10.0 Introduction}

In class VI you had already learnt that variables can take on different values and the value of constants is fixed. You had also learnt how to represent variables and constants using letters like \(x\), \(\mathrm{y}, \mathrm{z}, \mathrm{a}, \mathrm{b}, \mathrm{p}, \mathrm{m}\) etc. You also came across simple algebraic expressions like \(2 x-3\) and so on. You had also seen how these expressions are usefull in formulating and solving problems.

In this chapter, you will learn more about algebraic expressions and their addition and subtraction. However, before doing this we will get acquainted to words like 'terms', 'like terms','unlike terms' and 'coefficients'.

Let us first review what you had learnt in class VI, Algebra.

\section*{Exercise - 10.1}
1. Find the rule which gives the number of matchsticks required to make the following patterns-
(i) \(\mathrm{HHHH} . .\).
(ii) VVVV........
2. Given below is a pattern made from coloured tiles and white tiles.

Figure 1

Figure 2

Figure 3
(i) Draw the next two figures in the pattern above.
(ii) Fill the table given below and express the pattern in the form of an algebraic expression.
\begin{tabular}{|l|c|c|c|c|c|}
\hline Figure Number & 1 & 2 & 3 & 4 & 5 \\
\hline Number of coloured tiles & 4 & & & & \\
\hline
\end{tabular}
(iii) Fill the table given below and express the pattern in the form of an algebraic expression.
\begin{tabular}{|l|c|c|c|c|c|}
\hline Figure Number & 1 & 2 & 3 & 4 & 5 \\
\hline Number of total tiles & 5 & & & & \\
\hline
\end{tabular}
3. Write the following statements using variables, constants and arithmetic operations.
(i) 6 more than p
(ii) ' \(x\) ' is reduced by 4
(iii) 8 subtracted from \(y\)
(iv) q multiplied by '-5'
(v) y divided by 4
(vi) One-fourth of the product of ' p ' and ' q '
(vii) 5 added to the three times of ' \(z\) '
(viii) x multiplied by 5 and added to ' 10 '
(ix) 5 subtracted from two times of ' \(y\) '
(x) y multiplied by 10 and added to 13
4. Write the following expressions in statements.
(i) \(x+3\)
(ii) \(\mathrm{y}-7\)
(iii) \(10 l\)
(iv) \(\frac{x}{5}\)
(v) \(3 m+11\)
(vi) \(2 y-5\)
5. Some situations are given below. State the number in situations is a variable or constant?

Example : Our age - its value keeps on changing so it is an example of a variable quantity.
(i) The number of days in the month of January
(ii) The temperature of a day
(iii) Length of your classroom
(iv) Height of the growing plant

\subsection*{10.1 Algebraic Term and Numeric term}

Consider the expression \(2 x+9\).
Here ' \(x\) ' is multiplied by 2 and then 9 is added to it. Both ' \(\mathbf{2 x}\) ' and ' 9 ' are terms in the expression \(\mathbf{2 x + 9}\). Moreover \(2 x\) is called algebraic term and 9 is called numeric term.

Consider another expression \(3 x^{2}-11 y\).
\(3 x^{2}\) is formed by multiplying \(3, x\) and \(x\). 11y is the product of 11 and \(y .11 y\) is then subtracted from \(3 x^{2}\) to get the expression \(3 x^{2}-11 y\). In the expression \(\mathbf{3} \boldsymbol{x}^{2} \mathbf{- 1 1 y}, \mathbf{3} \boldsymbol{x}^{2}\) is one term and 11 y is the other term.

When we multiply \(\boldsymbol{x}\) with \(\boldsymbol{x}\) we can write this as \(x^{2}\). This is similar to writing 4 multiplied by 4 as \(4^{2}\). Similarly when we multiply \(\boldsymbol{x}\) three times i.e., \(\boldsymbol{x} \times \boldsymbol{x}\) \(x \boldsymbol{x}\) we can write this as \(x^{3}\). This is similar to writing \(6 \times 6 \times 6\) as \(6^{3}\).

\section*{Do This}

In the expressions given below identify and write all the terms.
(i) \(5 x^{2}+3 y+7\)
(ii) \(5 x^{2} y+3\)
(iii) \(3 x^{2} y\)
(iv) \(5 \mathrm{x}-7\)
(v) \(5 x+8-2(-y)\)
(vi) \(7 x^{2}-2 x\)

\subsection*{10.1.1 Like and unlike terms}

Let us observe the following examples.
(i) \(5 x\) and \(8 x\)
(ii) \(7 a^{2}\) and \(14 a^{2}\)
(iii) \(3 x y\) and \(4 x y\)
(iv) \(3 x y^{2}\) and \(4 x^{2} y\)

In the first example, both terms contain the same variable i.e. \(x\) and the exponent of the variable is also the same i.e. 1

In the second example, both terms contain the same variable i.e. \(a\) and the exponent of the variable is also the same i.e. 2

In the third example, both terms contain the same variables i.e. \(x\) and \(y\) and the exponent of variable \(x\) is 1 and the exponent of variable \(y\) is 1 .

In the fourth example, both terms contain the same variables \(x\) and \(y\). However, their exponents are not the same. In the first term, the exponent of \(x\) is 1 and in the second it is 2 . Similarly, in the first term the exponent of \(y\) is 2 and in the second term it is 1 .

The first three pairs of terms are examples of 'like terms' while the fourth is a pair of 'unlike terms'.

\section*{Like terms are terms which contain the same variables with the same exponents.}

\section*{Do This}
1. Group the like terms together.
\[
12 x, 12,25 x,-25,25 y, 1, x, 12 y, y, 25 x y, 5 x^{2} y, 7 x y^{2}, 2 x y, 3 x y^{2}, 4 x^{2} y
\]
2. State true or false and give reasons for your answer.
(i) \(7 x^{2}\) and \(2 x\) are unlike terms
(ii) \(\mathrm{pq}^{2}\) and \(-4 \mathrm{pq}^{2}\) are like terms
(iii) \(x y,-12 x^{2} y\) and \(5 x y^{2}\) are like terms

\subsection*{10.2 Coefficient}

In 9 xy
\[
\begin{array}{ll}
\text { ' } 9 \text { ' is the coefficient of ' } x y \text { ' as } & 9(x y)=9 x y \\
\text { ' } x \text { ' is the coefficient of ' } 9 y \text { ' as } & x(9 y)=9 x y \\
' y \text { ' is the coefficient of ' } 9 x \text { ' as } & y(9 x)=9 x y \\
\text { ' } 9 x^{\prime} \text { is the coefficient of ' } y \text { ' as } & 9 x(y)=9 x y \\
9 y \text { is the coefficient of ' } x \text { ' as } & 9 y(x)=9 x y \\
x y \text { is the coefficient of ' } 9 \text { ' as } & x y(9)=9 x y
\end{array}
\]

Since 9 has a numerical value it is called a numerical coefficient. \(x, y\) and \(x y\) are literal coefficients because they are variables.

Similarly in ' \(-5 x\) ', ' -5 ' is the numerical coefficient and ' \(x\) ' is the literal coefficient.

\section*{Try This}
(i) What is the numerical coefficient of ' \(x\) '?
(ii) What is the numerical coefficient of ' \(-y\) '?
(iii) What is the literal coefficient of ' -3 z ' ?
(iv)Is a numerical coefficient a constant?
(v) Is a literal coefficient always a variable?

\subsection*{10.3 Expressions}

An expression is a single term or a combination of terms connected by the symbols ' + ' (plus) or ' - ' (minus).
For example : \(6 x+3 y, 3 x^{2}+2 x+y, 10 y^{3}+7 y+3,9 a+5,5 a+7 b, 9 x y, 5+7-2 x, 9+3-2\)
Note: multiplication ' \(\times\) ' and division ' \(\because\) ' do not separate terms. For example \(2 x \times 3 y\) and \(\frac{2 x}{3 y}\) are single terms.

\section*{Do This}
1. How many terms are there in each of the following expressions?
(i) \(x+y\)
(ii) \(11 x-3 y-5\)
(iii) \(6 x^{2}+5 x-4\)
(iv) \(x^{2} z+3\)
(v) \(5 x^{2} y\)
(vi) \(x+3+y\)
(vii) \(x-\frac{11}{3}\)
(viii) \(\frac{3 x}{7 y}\)
(ix) \(2 \mathrm{z}-\mathrm{y}\)
(x) \(3 x+5\)

\subsection*{10.3.1 Numerical expressions and algebraic expressions}

Consider the following examples.
(i) \(1+2-9\)
(ii) -3-5
(iii) \(x-\frac{11}{3}\)
(iv) \(4 y\)
(v) \(9+(6-5)\)
(vi) \(3 x+5\)
(vii) \(\quad(17-5)+4\)
(viii) \(2 x-y\)

Do you find any algebraic terms in the examples (i), (ii), (v) and (vii)?
If every term of an expression is a constant term, then the expression is called numerical expression. If an expression has at least one algebraic term, then the expression is called an algebraic expression.

Which are the algebraic expressions in the above examples?

\subsection*{10.3.2 Types of algebraic expressions}

Algebraic expressions are named according to the number of terms present in them.
\begin{tabular}{|c|c|c|}
\hline Number of terms & Name of the Expression & Examples \\
\hline One term & Monomial & \begin{tabular}{l}
(a) \(x\) (b) \(7 x y z\) \\
(c) \(3 x^{2} y\) \\
(d) \(q z^{2}\)
\end{tabular} \\
\hline Two unlike terms & Binomial & \begin{tabular}{l}
(a) \(a+4 x\) \\
(b) \(x^{2}+2 y\) \\
(c) \(3 x^{2}-y^{2}\)
\end{tabular} \\
\hline \begin{tabular}{l}
Three unlike terms \\
More than one \\
unlike terms
\end{tabular} & \begin{tabular}{l}
Trinomial \\
Multinomial
\end{tabular} & \begin{tabular}{l}
(a) \(a x^{2}+4 x+2\) \\
(b) \(7 x^{2}+9 y^{2}+10 z^{3}\) \\
(a) \(4 x^{2}+2 x y+c x+d\) \\
(b) \(9 p^{2}-11 q+19 r+t\)
\end{tabular} \\
\hline
\end{tabular}

Note: Binomial, trinomials are also multinomial algebraic expressions.

\section*{Do This}
1. Give two examples for each type of algebraic expression.
2. Identify the expressions given below as monomial, binomial, trinomial and multinomial.
(i) \(5 x^{2}+y+6\)
(ii) \(3 x y\)
(iii) \(5 x^{2} y+6 x\)
(iv) \(a+4 x-x y+x y z\)

\subsection*{10.4 Degree of algebraic expressions}

Before discussing the degree of algebraic expressions let us understand what we mean by the degree of a monomial.

\subsection*{10.4.1 Degree of a monomial}

Consider the term \(9 x^{2} y^{2}\)
1. What is the exponent of ' \(x\) ' in the above term?
2. What is the exponent of 'y' in the above term?
3. What is the sum of these two exponents?

The sum of all exponents of the variables present in a monomial is called the degree of the term or degree of the monomial.

Observe the following table.
\begin{tabular}{|l|l|l|l|l|l|}
\hline S. No. & Monomial & \multicolumn{3}{|c|}{ Exponents } & Degree of the monomial \\
\hline & & \(x\) & \(y\) & \(z\) & \\
\hline 1 & \(x\) & 1 & - & - & 1 \\
\hline 2 & \(7 x^{2}\) & 2 & - & - & 2 \\
3 & \(-3 x y z\) & 1 & 1 & 1 & \(1+1+1=3\) \\
4 & \(8 y^{2} z^{2}\) & - & 2 & 2 & \(2+2=4\) \\
\hline
\end{tabular}

\subsection*{10.4.2 Degree of constant terms}

Let us discuss the degree of the constant term 5 .

Since \(x^{0}=1\), we can write 5 as \(5 x^{0}\) as the exponent of the variable is ' 0 '.

\section*{Degree of constant term is zero.}

\subsection*{10.4.3 Degree of algebraic expressions}

Observe the following table.
\begin{tabular}{|l|l|l|l|l|l|l|}
\hline \multirow{2}{*}{ S. No. } & \multirow{2}{*}{ Algebraic Expression } & \multicolumn{4}{|c|}{ Degree of each term } & \multirow{2}{*}{ Highest Degree } \\
\cline { 3 - 6 } & & \begin{tabular}{c} 
First \\
term
\end{tabular} & \begin{tabular}{c} 
Second \\
term
\end{tabular} & \begin{tabular}{c} 
Third \\
term
\end{tabular} & \begin{tabular}{c} 
Fourth \\
term
\end{tabular} & \\
\hline 1. & \(7 x y^{2}\) & 3 & - & - & - & 3 \\
\hline 2 & \(3 y-x^{2} y^{2}\) & 1 & 4 & - & - & 4 \\
\hline 3 & \(4 x^{2}+3 x y z+y\) & 2 & 3 & 1 & - & 3 \\
\hline 4 & \(p q-6 p^{2} q^{2}-p^{2} q+9\) & 2 & 4 & 3 & 0 & 4 \\
\hline
\end{tabular}

In the second example the highest degree of one of the terms is 4 . Therefore, the degree of the expression is 4 . Similarly, the degree of the third expression is 3 and the degree of the fourth expression is 4 .

The highest of the degrees of all the terms of an expression is called the degree of the expression.

\section*{Exercise - 10.2}
1. Identify and write the like terms in each of the following groups.
(i)
\(a^{2}, b^{2},-2 a^{2}, c^{2}, 4 a\)
(ii) \(3 a, 4 x y,-y z, 2 z y\)
(iii) \(-2 x y^{2}, x^{2} y, 5 y^{2} x, x^{2} z\)
(iv) \(7 p, 8 p q,-5 p q,-2 p, 3 p\)
2. State whether the following are numerical expressions or algebraic expressions.
(i) \(x+1\)
(ii) \(3 m^{2}\)
(iii) \(-30+16\)
(iv) \(4 p^{2}-5 q^{2}\)
(v) 96
(vi) \(x^{2}-5 y z\)
(vii) \(215 x^{2} y z\)
(viii) \(95 \div 5 \times 2\)
(ix) \(2+m+n\)
(x) \(310+15+62\)
(xi) \(11 a^{2}+6 b^{2}-5\)
3. Identify monomial or binomial or trinomial from the following multinomials and write them.
(i) \(y^{2}\)
(ii) \(4 y-7 z\)
(iii) \(1+x+x^{2}\)
(iv) \(7 m n\)
(v) \(a^{2}+b^{2}\)
(vi) 100 xyz
(vii) \(a x+9\)
(viii) \(p^{2}-3 p q+r\)
(ix) \(3 y^{2}-x^{2} y^{2}+4 x\)
(x) \(7 x^{2}-2 x y+9 y^{2}-11\)
4. What is the degree of each of the monomials.
(i) \(7 y\)
(ii) \(-x y^{2}\)
(iii) \(x y^{2} z^{2}\)
(iv) \(-11 y^{2} z^{2}\)
(v) \(3 m n\)
(vi) \(-5 p q^{2}\)
5. Find the degree of each algebraic expression.
(i) \(3 x-15\)
(ii) \(x y+y z\)
(iii) \(2 y^{2} z+9 y z-7 z-11 x^{2} y^{2}\)
(iv) \(2 y^{2} z+10 y z\)
(v) \(p q+p^{2} q-p^{2} q^{2}\)
(vi) \(a x^{2}+b x+c\)
6. Write any two Algebraic expressions with the same degree.

\subsection*{10.5 Addition and subtraction of like terms}

Observe the following problems.
1. Number of pencils with Vinay is equal to 4 times the pencils with Siddu. What is the total number of pencils both have together?
2. Tony and Basha went to a store. Tony bought 7 books and Basha bought 2 books. All the books are of same cost. How much money did Tony spend more than Basha?

To find answers to such questions we have to know how to add and subtract like terms. Let us learn how to solve the following.
1. Number of pencils with Siddhu is not given in the problem, we shall take the number as ' \(x\) '.

Vinay has 4 times of Siddu i.e., \(4 \times x=4 x\)
To find the total number of pencils, we have to add x and \(4 x\)
Therefore, the total number of pencils \(=x+4 x\)
\[
\begin{aligned}
& =(1+4) x \\
& =5 x \quad \text { (distributive law })
\end{aligned}
\]
2. Since the cost of each book is not given, we shall take it as ' \(y\) '.

Therefore, Tony spends \(7 \times y=₹ 7 y\)
Basha spends \(2 x y=₹ 2 y\)
Therefore, the amount spent by Tony more than Basha
\[
\begin{aligned}
& =7 y-2 y \\
& =(7-2) y \\
& =₹ 5 y \text { (distributive law) }
\end{aligned}
\]

Thus, we can conclude that.
The sum of two or more like terms is a like term with a numerical coefficient equal to the sum of the numerical coefficients of all the like terms in addition.

The difference between two like terms is a like term with a numerical coefficient equal to the difference between the numerical coefficients of the two like terms.

\section*{Do This}
1. Find the sum of the like terms.
(i) \(5 x, 7 x\)
(ii) \(7 x^{2} y,-6 x^{2} y\)
(iii) \(2 m, 11 m\)
(iv) \(18 a b, 5 a b, 12 a b\)
(v) \(3 x^{2},-7 x^{2}, 8 x^{2}\)
(vi) \(4 m^{2}, 3 m^{2},-6 m^{2}, m^{2}\)
(vii) \(18 p q,-15 p q, 3 p q\)
2. Subtract the first term from the second term.
(i) \(2 x y, 7 x y\)
(ii) \(5 a^{2}, 10 a^{2}\)
(iii) \(12 y, 3 y\)
(iv) \(6 x^{2} y, 4 x^{2} y\)
(v) \(6 x y,-12 x y\)

\subsection*{10.5.1 Addition and subtraction of unlike terms}
\(3 x\) and \(4 y\) are unlike terms. Their sum can be wirtten as \(3 x+4 y\).
However, ' \(x\) ' and ' \(y\) ' are different variables so we can not apply distributive law and thus cannot add them.

\subsection*{10.6 Simplification of an algebraic expression}

Consider the expression \(9 x^{2}-4 x y+5 y^{2}+2 x y-y^{2}-3 x^{2}+6 x y\)
We can see that there are some like terms in the expression. These are \(9 x^{2},-3 x^{2} ; 5 y^{2}\), \(-y^{2} ;-4 x y, 2 x y\) and \(6 x y\). On adding the like terms we get an algebraic expression in its simplified form. Let us see how the expression given above is simplified.
\begin{tabular}{|c|l|l|}
\hline S.No. & Steps & \multicolumn{1}{|c|}{ Process } \\
\hline 1. & Write down the expression & \(9 x^{2}-4 x y+5 y^{2}+2 x y-y^{2}-3 x^{2}+6 x y\) \\
\hline 2. & Group the like terms together & \(\left(9 x^{2}-3 x^{2}\right)+(2 x y-4 x y+6 x y)+\left(5 y^{2}-y^{2}\right)\) \\
\hline 3. & Addding the like terms & \((9-3) x^{2}+(2-4+6) x y+(5-1) y^{2}=6 x^{2}+4 x y+4 y^{2}\) \\
\hline
\end{tabular}

Note : If no two terms of an expression are alike then it is said to be in the simplified form.

Let us study another example: \(5 x^{2} y+2 x^{2} y+4+5 x y^{2}-4 x^{2} y-x y^{2}-9\)
Step 1: \(5 x^{2} y+2 x^{2} y+4+5 x y^{2}-4 x^{2} y-x y^{2}-9\)
Step 2: \(\left(5 x^{2} y+2 x^{2} y-4 x^{2} y\right)+\left(5 x y^{2}-x y^{2}\right)+(4-9)\) (bringing the like terms together)
Step 3: \(3 x^{2} y+4 x y^{2}-5\)

\section*{Do This}
1. Simplify the following.
(i) \(3 m+12 m-5 m\)
(ii) \(25 y z-8 y z-6 y z\)
(iii) \(10 m^{2}-9 m+7 m-3 m^{2}-5 m-8\)
(iv) \(9 x^{2}-6+4 x+11-6 x^{2}-2 x+3 x^{2}-2\)
(v) \(3 a^{2}-4 a^{2} b+7 a^{2}-b^{2}-a b\)
(vi) \(5 x^{2}+10+6 x+4+5 x+3 x^{2}+8\)

\subsection*{10.7 Standard form of an expression}

Consider the expression \(3 x+5 x^{2}-9\). The degrees of first, second and third terms are 1,2 , and 0 respectively. Thus, the degrees of terms are not in the descending order.
By re-arranging the terms in such a way that their degrees are in descending order; we get the expression \(5 x^{2}+3 x-9\). Now the expression is said to be in standard form.

Let us consider \(3 c+6 a-2 b\). Degrees of all the terms in the expression are same. Thus the expression is said to be already in standard form. If we write it in alphabetical order as \(6 \mathrm{a}-2 \mathrm{~b}+3 \mathrm{c}\) it looks more beautiful.

In an expression, if the terms are arranged in such a way that the degrees of the terms are in descending order then the expression is said to be in standard form.

Examples of expressions in standard form \(\begin{array}{lll}\text { (i) } 7 x^{2}+2 x+11 & \text { (ii) } 5 y^{2}-6 y-9\end{array}\)

\section*{Do This}
1. Write the following expressions in standard form.
(i) \(3 x+18+4 x^{2}\)
(ii) \(8-3 x^{2}+4 x\)
(iii) \(-2 m+6-3 m^{2}\)
(iv) \(y^{3}+1+y+3 y^{2}\)
2. Identify the expressions that are in standard form?
(i) \(9 x^{2}+6 x+8\)
(ii) \(9 x^{2}+15+7 x\)
(iii) \(9 x^{2}+7\)
(iv) \(9 x^{3}+15 x+3\)
(v) \(15 x^{2}+x^{3}+3 x\)
(vi) \(x^{2} y+x y+3\)
(vii) \(x^{3}+x^{2} y^{2}+6 x y\)
3. Write 5 different expressions in standard form.

\subsection*{10.8 Finding the value of an expression}

Example 1: Find the value of \(3 x^{2}\) if \(x=-1\)
Solution: Step 1: \(3 x^{2}\) (write the expression)
Step 2: 3( -1\()^{2}\) (substitute the value of variable)
Step 3: 3(1)=3
Example 2: Find the value of \(x^{2}-y+2\) if \(x=0\) and \(y=-1\)

Solution: Step 1: \(x^{2}-y+2\) (write the expression)
Step 2: \(0^{2}-(-1)+2\) (substitute the value of variable)
Step 3: \(1+2=3\)
Example 3: Area of a triangle is given by \(A=\frac{1}{2} b h\). If \(b=12 \mathrm{~cm}\) and \(h=7 \mathrm{~cm}\) find the area of the triangle.

Solution: \(\quad\) Step 1: \(\quad A=\frac{1}{2} b h\)
Step 2: \(\quad A=\frac{1}{2} \times 12 \times 7\)
Step 3: \(A=42\) sq. cm.

\section*{Try This}
1. Find the value of the expression ' \(-9 x^{\prime}\) if \(x=-3\).
2. Write an expression whose value is equal to -9 , when \(x=-3\).

\section*{Exercise - 10.3}
1. Find the length of the line segment \(P R\) in the following figure in terms of ' \(a\) '.

2. (i) Find the perimeter of the following triangle.

(ii) Find the perimeter of the following rectangle.

3. Subtract the second term from first term.
(i) \(8 x, 5 x\)
(ii) \(5 p, 11 p\)
(iii) \(13 m^{2}, 2 m^{2}\)
4. . Find the values of following monomials, if \(x=1\).
(i) \(-x\)
(ii) \(4 x\)
(iii) \(-2 x^{2}\)
5. Simplify and find the value of \(4 x+x-2 x^{2}+x-1\), when \(x=-1\).
6. Write the expression \(5 x^{2}-4-3 x^{2}+6 x+8+5 x-13\) in its simplified form. Find its value when \(x=-2\).
7. If \(x=1\) and \(y=2\), find the values of the following expressions.
(i) \(4 x-3 y+5\)
(ii) \(x^{2}+y^{2}\)
(iii) \(x y+3 y-9\)
8. Area of a rectangle is given by \(\mathrm{A}=l \times b\). If \(l=9 \mathrm{~cm}, b=6 \mathrm{~cm}\), find its area?
9. Simple interest is given by \(I=\frac{P T R}{100}\). If \(P=₹ 900, T=2\) years; and \(R=5 \%\), find the simple interest.
10. The relationship between speed \((\mathrm{s})\), distance \((\mathrm{d})\) and time \((\mathrm{t})\) is given by \(\mathrm{s}=\frac{\mathrm{d}}{\mathrm{t}}\). Find the value of s , if \(\mathrm{d}=135\) meters and \(\mathrm{t}=10\) seconds.

\subsection*{10.9 Addition of algebraic expressions}

Consider the following problems.
1. Sameera has some mangoes. Padma has 9 more than Sameera. Mary says that she has 4 more mangoes than the number of mangoes Sameera and Padma have together. How many mangoes does Mary have?

Since we do not know the number of mangoes that Sameera has, we shall take them to be x mangoes.

Padma has 9 more mangoes than Sameera.
Therefore, the number of mangoes Padma has \(=x+9\) mangoes
Mary has 4 more mangoes than those Sameera and Padma have together.
Therefore, the number of mangoes Mary has \(=x+(x+9)+4\) mangoes
\[
=2 x+13 \text { mangoes }
\]
2. In a Mathematics test Raju got 11 marks more than Imran. Rahul got 4 marks less than what Raju and Imran got together. How much did Rahul score?

Since we do not know Imran's marks, we shall take them to be x marks.
Hint: Why are we taking Imran's marks as \(x\) ?
Raju got 11 more marks than Imran, therefore marks scored by Raju \(=x+11\) marks
Rahul got 4 marks less than the marks Raju and Imran scored together \(=x+x+11-4\) marks
\[
=2 x+7 \text { marks }
\]

In both the situations given above, we have to add and subtract algebraic expressions. There are number of real life situations in which we need to do this. Let us now learn how to add or subtract algebraic expressions.

\subsection*{10.9.1 Addition of Expressions}

The sum of expressions can be obtained by adding like terms. This can be done in two ways.
(i) Column or Vertical Method
(ii) Row or Horizontal Method
(i) Column or Vertical Method

Example 4: Add \(3 x^{2}+5 x-4\) and \(6+6 x^{2}\)
Solution:
\begin{tabular}{|c|c|c|}
\hline S. No. & Steps & Process \\
\hline 1 & Write the expressions in standard form if necessary & \begin{tabular}{l}
(i) \(3 x^{2}+5 x-4=3 x^{2}+5 x-4\) \\
(ii) \(6+6 x^{2}=6 x^{2}+6\)
\end{tabular} \\
\hline 2 & Write one expression below the other such that the like terms come in the same column & \[
\begin{aligned}
& 3 x^{2}+5 x-4 \\
& 6 x^{2}+6
\end{aligned}
\] \\
\hline 3. & Add the like terms column wise and write the result just below the concerned column & \[
\begin{aligned}
& 3 x^{2}+5 x-4 \\
& 6 x^{2}+6 \\
& \hline 9 x^{2}+5 x+2 \\
& \hline
\end{aligned}
\] \\
\hline
\end{tabular}

Example 5: Add \(5 x^{2}+9 x+6,4 x+3 x^{2}-8\) and \(5-6 x\)
Solution: \(\quad\) Step 1: \(\quad 5 x^{2}+9 x+6=5 x^{2}+9 x+6\)
\[
\begin{aligned}
4 x+3 x^{2}-8 & =3 x^{2}+4 x-8 \\
5-6 x & =-6 x+5
\end{aligned}
\]

Step 2: \(\quad 5 x^{2}+9 x+6\)
\[
3 x^{2}+4 x-8
\]
\[
-6 x+5
\]

Step 3: \(\quad 5 x^{2}+9 x+6\)
\[
3 x^{2}+4 x-8
\]
\[
-6 x+5
\]
\[
8 x^{2}+7 x+3
\]
(ii) Row or Horizontal Method

Example 6: Add \(3 x^{2}+5 x-4\) and \(6+6 x^{2}\)
\begin{tabular}{|c|l|l|}
\hline S. No. & \multicolumn{1}{|c|}{ Steps } & \multicolumn{1}{c|}{ Process } \\
\hline 1 & \begin{tabular}{l} 
Write all expressions with addition + \\
symbol in between them.
\end{tabular} & \(3 x^{2}+5 x-4+6+6 x^{2}\) \\
\hline 2 & \begin{tabular}{l} 
Re-arrange the term by grouping \\
the like terms together.
\end{tabular} & \(\left(3 x^{2}+6 x^{2}\right)+(5 x)+(-4+6)\) \\
\hline 3 & Simplify the coefficients & \((3+6) x^{2}+5 x+2\) \\
\hline 4 & \begin{tabular}{l} 
Write the resultant expression in \\
standard form.
\end{tabular} & \(9 x^{2}+5 x+2\) \\
\hline
\end{tabular}

\section*{Do This}
1. Add the following expressions.
(i) \(x-2 y, 3 x+4 y\)
(ii) \(4 m^{2}-7 n^{2}+5 m n, 3 n^{2}+5 m^{2}-2 m n\)
(iii) \(3 a-4 b, 5 c-7 a+2 b\)

\subsection*{10.9.2 Subtraction of algebraic expressions}

\subsection*{10.9.2(a)Additive inverse of an expression}

If we take a positive number ' 9 ' then there exists ' -9 ' such that \(9+(-9)=0\).
Here we say that ' -9 ' is the additive inverse of ' 9 ' and ' 9 ' is the additive inverse of ' -9 '.
Thus, for every positive number, there exists a negative number such that their sum is zero. These two numbers are called the additive inverse of the each other.

Is this true for algebraic expressions also? Does every algebraic expression have an additive inverse?

If so, what is the additive inverse of ' \(3 x\) '?
For ' \(3 x\) ' there also exists ' \(-3 x\) ' such that \(3 x+(-3 x)=0\)
Therefore, ' \(-3 x\) ' is the additive inverse of ' \(3 x\) ' and ' \(3 x\) ' is the additive inverse of ' \(-3 x\) '.
Thus, for every algebraic expression there exists another algebraic expression such that their sum is zero. These two expressions are called the additive inverse of the each other.

Example 7: Find the additive inverse of the expression ( \(6 x^{2}-4 x+5\) ).
Solution: Additive inverse of \(6 x^{2}-4 x+5=-\left(6 x^{2}-4 x+5\right)=-6 x^{2}+4 x-5\)

\subsection*{10.9.2(b) Subtraction}

Let \(A\) and \(B\) be two algebraic expressions, then \(A-B=A+(-B)\)
i.e. to subtract B from A , we add the additive inverse of B to A .

Now, let us subtract algebraic expressions using both column and row methods-

\section*{(i) Column or Vertical Method}

Example 8: Subtract \(3 a+4 b-2 c\) from \(3 c+6 a-2 b\)

\section*{Solution:}
\(\left.\)\begin{tabular}{|c|l|l|}
\hline S. No. & \multicolumn{1}{|c|}{ Steps } & \multicolumn{1}{c|}{ Process } \\
\hline 1 & Write both expressions in standard form \\
if necessary
\end{tabular}\(\quad\)\begin{tabular}{l}
\(3 c+6 a-2 b=6 a-2 b+3 c\) \\
\(3 a+4 b-2 c=3 a+4 b-2 c\)
\end{tabular} \right\rvert\, \begin{tabular}{l} 
Write the expressions one below the other such that \\
the expression to be subtracted comes in the second \\
row and the like terms come one below the other.
\end{tabular}\(~\)\begin{tabular}{l}
\(3 a-2 b+3 c\) \\
\(3 a+4 b-2 c\)
\end{tabular}

Example 9: Subtract \(4+3 m^{2}\) from \(4 m^{2}+7 m-3\)
Solution: \(\quad\) Step 1: \(4 m^{2}+7 m-3=4 m^{2}+7 m-3\)
\[
4+3 m^{2}=3 m^{2}+4
\]

Step 2: \(4 m^{2}+7 m-3\)
\[
3 m^{2} \quad+4
\]

Step 3: \(4 m^{2}+7 m-3\)
\[
3 m^{2} \quad+4
\]

Step 4: \(4 m^{2}+7 m-3\)
\(3 m^{2}+4\)
\begin{tabular}{l}
\(-\quad-\) \\
\hline\(m^{2}+7 m-7\) \\
\hline
\end{tabular}

\section*{(ii) Row or Horizontal Method}

Example 10: Subtract \(3 a+4 b-2 c\) from \(3 c+6 a-2 b\)

\section*{Solution:}
\begin{tabular}{|c|l|c|}
\hline S. No. & \multicolumn{1}{|c|}{ Steps } & \multicolumn{1}{c|}{ Process } \\
\hline 1 & \begin{tabular}{l} 
Write the expressions in one row with the \\
expression to be subtracted in a bracket with \\
assigning negative sign to it.
\end{tabular} & \(3 c+6 a-2 b-(3 a+4 b-2 c)\) \\
\hline 2 & \begin{tabular}{l} 
Add the additive inverse of the second \\
expression to the first expression
\end{tabular} & \(3 c+6 a-2 b-3 a-4 b+2 c\) \\
\hline 3 & \begin{tabular}{l} 
Group the like terms and add or subtract \\
(as the case may be)
\end{tabular} & \begin{tabular}{l}
\((3 c+2 c)+(6 a-3 a)+(-2 b-4 b)\) \\
\(=5 c+3 a-6 b\)
\end{tabular} \\
\hline 4 & Write in standard form. & \(3 a-6 b+5 c\) \\
\hline
\end{tabular}

Example 11: Subtract \(3 m^{3}+4\) from \(6 m^{3}+4 m^{2}+7 m-3\)
Solution: \(\quad\) Step 1: \(6 m^{3}+4 m^{2}+7 m-3-\left(3 m^{3}+4\right)\)
Step 2: \(6 m^{3}+4 m^{2}+7 m-3-3 m^{3}-4\)
Step 3: \(\left(6 m^{3}-3 m^{3}\right)+4 m^{2}+7 m-3-4\)
\[
=3 m^{3}+4 m^{2}+7 m-7
\]

Step 4: \(3 m^{3}+4 m^{2}+7 m-7\)
1. Add the following algebraic expressions using both horizontal and vertical methods. Did you get the same answer with both methods.
(i) \(x^{2}-2 x y+3 y^{2} ; 5 y^{2}+3 x y-6 x^{2}\)
(ii) \(4 a^{2}+5 b^{2}+6 a b ; 3 a b ; 6 a^{2}-2 b^{2} ; 4 b^{2}-5 a b\)
(iii) \(2 x+9 y-7 z ; 3 y+z+3 x ; 2 \mathrm{x}-4 \mathrm{y}-\mathrm{z}\)
(iv) \(2 x^{2}-6 x+3 ;-3 x^{2}-x-4 ; 1+2 x-3 x^{2}\)
2. Simplify: \(2 x^{2}+5 x-1+8 x+x^{2}+7-6 x+3-3 x^{2}\)
3. Find the perimeter of the following rectangle?

4. Find the perimeter of a triangle whose sides are \(2 a+3 b, b-a, 4 a-2 b\).

5. Subtract the second expression from the first expression
(i) \(2 a+b, a-b\)
(ii) \(x+2 y+z,-x-y-3 z\)
(iii) \(3 a^{2}-8 a b-2 b^{2}, 3 a^{2}-4 a b+6 b^{2}\)
(iv) \(4 p q-6 p^{2}-2 q^{2}, 9 p^{2}\)
(v) \(7-2 x-3 x^{2}, 2 x^{2}-5 x-3\)
(vi) \(5 x^{2}-3 x y-7 y^{2}, 3 x^{2}-x y-2 y^{2}\)
(vii) \(6 m^{3}+4 m^{2}+7 m-3,3 m^{3}+4\)
6. Subtract the sum of \(x^{2}-5 x y+2 y^{2}\) and \(y^{2}-2 x y-3 x^{2}\) from the sum of \(6 x^{2}-8 x y-y^{2}\) and \(2 x y-2 y^{2}-x^{2}\).
7. What should be added to \(1+2 x-3 x^{2}\) to get \(x^{2}-x-1\) ?
8. What should be taken away from \(3 x^{2}-4 y^{2}+5 x y+20\) to get \(-x^{2}-y^{2}+6 x y+20\) ?
9. The sum of 3 expressions is \(8+13 a+7 a^{2}\). Two of them are \(2 a^{2}+3 a+2\) and \(3 a^{2}-4 a+1\). Find the third expression.
10. If \(\mathrm{A}=4 x^{2}+y^{2}-6 x y\);

B \(=3 y^{2}+12 x^{2}+8 x y\);
\(\mathrm{C}=6 x^{2}+8 y^{2}+6 x y\)
Find (i) \(\mathrm{A}+\mathrm{B}+\mathrm{C}\) (ii) \((\mathrm{A}-\mathrm{B})-\mathrm{C}\) (iii) \(2 \mathrm{~A}+\mathrm{B}\) (iv) \(\mathrm{A}-3 \mathrm{~B}\)

\section*{Looking Back}
- An algebraic expression is a single term or a combination of terms connected by the symbols ' + ' (plus) or ' - ' (minus).
- If every term of an expression is a constant term, then the ex-
 pression is called a numerical expression. If an expression has at least one algebraic term, then the expression is called an algebraic expression.
- An algebraic expression contaning one term is called a monomial. An algebraic expression contaning two unlike terms is called a binomial. An algebraic expression contaning three unlike terms is called a trinomial. An algebraic expression contaning two or more unlike terms is called a multinomial.
- The sum of all the exponents of the variables in a monomial is called the degree of the term or degree of monomial.
- The degree of any constant termis zero.
- The highest of the degrees of all the terms of the expression is called the degree of the expression.
- If no two terms of an expression are alike then the expression is said to be in its simplified form.
- In an expression, if the terms are arranged in a manner such that the degrees of the terms are in descending order then the expression is said to be in standard form.
- The sum of two or more like terms is a like term with a numerical coefficient equal to the sum of the numerical coefficients of all the like terms.
- The difference between two like terms is a like term with a numerical coefficient equal to the difference between the numerical coefficients of the two like terms.

\subsection*{11.0 Introduction}

The population of India according to 2011 census is about \(120,00,00,000\)
The approximate distance between the sun and the earth is \(15,00,00,000 \mathrm{~km}\).
The speed of the light in vacuum is about \(30,00,00,000 \mathrm{~m} / \mathrm{sec}\).
The population of Andhra Pradesh according to 2011 census is about \(8,50,00,000\).
These are all very large numbers. Do you find it easy to read, write and understand such large numbers? No, certainly not.

Thus, we need a way in which we can represent such larger numbers in a simpler manner. Exponents help us in doing so. In this chapter you will learn more about exponents and the laws of exponents.

\subsection*{11.1 Exponential Form}

Let us consider the following repeated additions:
\[
\begin{aligned}
& 4+4+4+4+4 \\
& 5+5+5+5+5+5 \\
& 7+7+7+7+7+7+7+7
\end{aligned}
\]

We use multiplication to shorten the representation of repeated additions by writing \(5 \times 4,6 \times 5\) and \(8 \times 7\) respectively.

Now can we express repeated multiplication of a number by itself in a simpler way?
Let us consider the following illustrations.
The population of Bihar as per the 2011 Census is about \(10,00,00,000\).
Here 10 is multiplied by itself for 8 times i.e. \(10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10\).
So we can write the population of Bihar as \(10^{8}\). Here 10 is called the base and 8 is called the exponent. \(10^{8}\) is said to be in exponential form and it is read as 10 raised to the power of 8 .

The speed of light in vacuum is \(30,00,00,000 \mathrm{~m} / \mathrm{sec}\). This is expressed as \(3 \times 10^{8} \mathrm{~m} / \mathrm{sec}\). in exponential form. In \(3 \times 10^{8}, 10^{8}\) is read as ' 10 raised to the power of 8 '. 10 is the base and 8 is the exponent.

The approximate distance between the sun and the earth is \(15,00,00,000 \mathrm{~km}\). This is expressed as \(15 \times 10^{7} \mathrm{~km}\) in exponential form. In \(10^{7}, 10\) is the base and 7 is the exponent.

The population of Andhra Pradesh according to 2011 census is about \(8,50,00,000\). This is expressed as \(85 \times 10^{6}\) in exponential form. \(10^{6}\) is read as ' 10 raised to the power of 6 '. Here 10 is the base and 6 is the exponent.

We can also use exponents in writing the expanded form of a given number for example the expanded form of \(36584=(3 \times 10000)+(6 \times 1000)+(5 \times 100)+(8 \times 10)+(4 \times 1)\)
\[
=\left(3 \times 10^{4}\right)+\left(6 \times 10^{3}\right)+\left(5 \times 10^{2}\right)+\left(8 \times 10^{1}\right)+(4 \times 1)
\]

\section*{Do This}
1. Write the following in exponential form. (values are rounded off)
(i) Total surface area of the Earth is \(510,000,000\) square kilometers.
(ii) Population of Rajasthan is approximately \(7,00,00,000\)
(iii) The approximate age of the Earth is 4550 million years.
(iv) 1000 km in meters
2. Express (i) 48951 (ii) 89325 in expanded form using exponents.

\subsection*{11.1.1 Exponents with other bases}

So far we have seen numbers whose base is 10 . However, the base can be any number.
For example \(\quad 81=3 \times 3 \times 3 \times 3=3^{4}\)
Here 3 is the base and 4 is the exponent.
Similarly, \(\quad 125=5 \times 5 \times 5=5^{3}\)
Here 5 is the base and 3 is the exponent.

Example 1: Which is greater \(3^{4}\) or \(4^{3}\) ?
\[
\begin{aligned}
& 3^{4}=3 \times 3 \times 3 \times 3=81 \\
& 4^{3}=4 \times 4 \times 4=64 \\
& 81>64
\end{aligned}
\]

Therefore, \(3^{4}>4^{3}\)

\section*{Do This}
1. Is \(3^{2}\) equal to \(2^{3}\) ? Justity.
2. Write the following numbers in exponential form. Also state the
(a) base
(b)exponent and (c) how it is read.
(i) 32
(ii) 64
(iii) 256
(iv) 243
(v) 49

\section*{Squared and cubed}

When any base is raised to the power 2 or 3 , it has a special name.
\(10^{2}=10 \times 10\) and is read as ' 10 raised to the power 2 ' or ' \(\mathbf{1 0}\) squared'. Similarly, \(4^{2}=4 \times 4\) and can be read as ' 4 raised to the power of 2 ' or ' 4 squared'.
\(10 \times 10 \times 10=10^{3}\) is read as ' \(\mathbf{1 0}\) raised to the power \(\mathbf{3}\) ' or ' \(\mathbf{1 0}\) cubed '.
Similarly, \(6 \times 6 \times 6=6^{3}\) and can be read as ' 6 raised to the power 3 ' or ' 6 cubed'.

In general, we can take any positive number 'a' as the base and write.
\(a \times a \quad=a^{2} \quad\) (this is read as 'a raised to the power of 2' or 'a squared')
\(a \times a \times a \quad=a^{3} \quad\) (this is read as 'a raised to the power of 3 ' or 'a cubed')
\(a \times a \times a \times a=a^{4} \quad\) (this is read as 'a raised to the power of 4')
\(\qquad\)
\(\ldots=a^{6}(\square)\) and so on.

Thus, we can say that \(a \times a \times a \times a \times a \times a \times\)..................... ' m ' times \(=a^{m}\) where ' a ' is the base and ' \(m\) ' is the exponent.

\section*{Do This}
1. Write the expanded form of the following.
(i) \(p^{7}\)
(ii) \(l^{4}\)
(iii) \(s^{9}\)
(iv) \(d^{6}\)
(v) \(z^{5}\)
2. Write the following in exponential form.

(ii) \(5 \times 5 \times 5 \times 5 \ldots \ldots . . . . . . . . . . . . . ~ ' n ' ~ t i m e s ~\)
(iii) \(q \times q \times q \times q \times q \ldots \ldots \ldots \ldots . . . . . . .15\) times
(iv) \(r \times r \times r \times \ldots \ldots . . . . . . . . . . . . ~ ' b ' ~ t i m e s ~\)

\subsection*{11.2 Writing a number in exponential form through prime factorization.}

Let us express the following numbers in the exponential form using prime factorization.
(i) 432
(ii) 450

Solution: (i) \(432=2 \times 216\)
\[
\begin{aligned}
& =2 \times 2 \times 108 \\
& =2 \times 2 \times 2 \times 54 \\
& =2 \times 2 \times 2 \times 2 \times 27 \\
& =2 \times 2 \times 2 \times 2 \times 3 \times 9 \\
& =2 \times 2 \times 2 \times 2 \times 3 \times 3 \times 3 \\
& =(2 \times 2 \times 2 \times 2) \times(3 \times 3 \times 3) \\
& =2^{4} \times 3^{3}
\end{aligned}
\]
\begin{tabular}{l|r}
2 & 432 \\
\hline 2 & 216 \\
\hline 2 & 108 \\
\hline 2 & 54 \\
\hline 3 & 27 \\
\hline 3 & 9 \\
\hline 3 & 3 \\
\hline & 1
\end{tabular}

Therefore, \(432=2^{4} \times 3^{3}\)
(ii) \(450=2 \times 225\)
\[
\begin{aligned}
& =2 \times 3 \times 75 \\
& =2 \times 3 \times 3 \times 25 \\
& =2 \times 3 \times 3 \times 5 \times 5 \\
& =2 \times 3^{2} \times 5^{2}
\end{aligned}
\]
\begin{tabular}{l|r}
2 & 450 \\
\hline 3 & 225 \\
\hline 3 & 75 \\
\hline 5 & 25 \\
\hline 5 & 5 \\
\hline & 1 \\
\hline
\end{tabular}

Therefore, \(450=2 \times 3^{2} \times 5^{2}\)

\section*{Do This}

Write the following in exponential form using prime factorization.
(i) 2500
(ii) 1296
(iii) 8000
(iv) 6300

\section*{Exercise - 11.1}
1. Write the base and the exponent in each case. Also, write the term in the expanded form.
(i) \(3^{4}\)
(ii) \((7 x)^{2}\)
(iii) \((5 a b)^{3}\)
(iv) \((4 y)^{5}\)
2. Write the exponential form of each expression.
(i) \(7 \times 7 \times 7 \times 7 \times 7\)
(ii) \(3 \times 3 \times 3 \times 5 \times 5 \times 5 \times 5\)
(iii) \(2 \times 2 \times 2 \times 3 \times 3 \times 3 \times 3 \times 5 \times 5 \times 5\)
3. Express the following as the product of exponents through prime factorization.
(i) 288
(ii) 1250
(iii) 2250
(iv) 3600
(v) 2400
4. Identify the greater number in each of the following pairs.
(i) \(2^{3}\) or \(3^{2}\)
(ii) \(5^{3}\) or \(3^{5}\)
(iii) \(2^{8}\) or \(8^{2}\)
5. If \(a=3, b=2\) find the value of (i) \(a^{b}+b^{a}\)
(ii) \(a^{a}+b^{b}\) (iii) \((a+b)^{b}\)
(iv) \((a-b)^{a}\)

\subsection*{11.3 Laws of exponents}

When we multiply terms with exponents we use some rules to find the product easily. These rules have been discussed here.

\subsection*{11.3.1 Multiplying terms with the same base}

Example 2: \(2^{4} \times 2^{3}\)
Solution: \(2^{4} \times 2^{3}=(\underbrace{2 \times 2 \times 2 \times 2}_{4 \text { times }}) \times \underbrace{2 \times 2 \times 2}_{3 \text { times }})\)
\[
=\frac{2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2}{7 \text { times }}
\]
\(=2^{7}\) and this is same as \(2^{4+3} \quad(\) as \(4+3=7)\)
Therefore, \(2^{4} \times 2^{3}=2^{4+3}\)
Example 3: \(5^{2} \times 5^{3}\)
Solution: \(\quad 5^{2} \times 5^{3}=(\underbrace{5 \times 5}) \times(\underbrace{5 \times 5 \times 5})\)
2 times 3 times

\(=5^{5}\) and this is same as \(5^{2+3} \quad(\) as \(2+3=5)\)
Therefore, \(5^{2} \times 5^{3}=5^{2+3}\)

\section*{Do This}

Find the values of \(2^{4}, 2^{3}\) and \(2^{7}\)
verify whether \(2^{4} \times 2^{3}=2^{7}\)
Find the values of \(5^{2}, 5^{3}\) and \(5^{5}\) and verify whether \(5^{2} \times 5^{3}=5^{5}\)

\section*{Example 4: \(a^{4} \times a^{5}\)}

Solution: \(\quad a^{4} \times a^{5}=(a \times a \times a \times a) \times(a \times a \times a \times a \times a)\)
\(=(a \times a \times a \times a \times a \times a \times a \times a \times a)\)
\(=a^{9}\) and this is same as \(a^{4+5} \quad(\) as \(4+5=9)\)
Therefore, \(a^{4} \times a^{5}=a^{4+5}\)

\section*{Based on the above observations we can say that.}
\(a^{m} \times a^{n}=(a \times a \times a\) \(\qquad\) ' \(m\) ' times \() \times(a \times a \times a \times\) \(\qquad\) \(n^{\prime}\) 'times \()=a^{m+n}\)

For any non-zero integer ' \(a\) ', and integers ' \(m\) ' and ' \(n\) '
\[
a^{m} \times a^{n}=a^{m+n}
\]

\section*{Do This}
1. Simplify the following using the formula \(a^{m} \times a^{n}=a^{m+n}\)
(i) \(3^{11} \times 3^{9}\)
(ii) \(\mathrm{p}^{5} \times \mathrm{p}^{8}\)
2. Find the appropriate number in place of the symbol '?' in the following.

Let ' k ' be any non zero integer
(i) \(\mathrm{k}^{3} \times \mathrm{k}^{4}=\mathrm{k}^{?}\)
(ii) \(\mathrm{k}^{15} \times \mathrm{k}^{?}=\mathrm{k}^{31}\)

\subsection*{11.3.2 Exponent of exponent}

\section*{Example 5 : Consider \(\left(3^{2}\right)^{3}\)}

Solution: Here ' \(3^{2}\) ' is the base and' 3 ' is the exponent
\(\left(3^{2}\right)^{3}=3^{2} \times 3^{2} \times 3^{2}\)
\(=3^{2+2+2} \quad\) (multplying terms with the same base)
\(=3^{6}\) and this is the same as \(3^{2 \times 3}\)
(as \(2 \times 3=6\) )
Therefore, \(\left(3^{2}\right)^{3}=3^{2 \times 3}\)

\section*{Do This}

Compute \(3^{6}\), cube of \(3^{2}\) and verify whether \(\left(3^{2}\right)^{3}=3^{6}\) ?

Example 6: Let us consider \(\left(4^{5}\right)^{3}\)
Solution : \(\left(4^{5}\right)^{3}=4^{5} \times 4^{5} \times 4^{5}\)
\[
\begin{array}{ll}
=4^{5+5+5} & \text { (multplying terms with the same base) } \\
=4^{15} \text { and this is same as } 4^{5 \times 3} & (\text { as } 5 \times 3=15)
\end{array}
\]

Therefore, \(\left(4^{5}\right)^{3}=4^{5 \times 3}\)

Example 7: \(\left(a^{m}\right)^{4}\)
Solution: \(\quad\left(a^{m}\right)^{4}=a^{m} \times a^{m} \times a^{m} \times a^{m}\)
\[
\begin{array}{ll}
=a^{m+m+m+m} & \text { (multplying terms with the same base) } \\
=a^{4 m} \text { and this is same as } a^{m \times 4} & (\text { as } 4 \times m=4 m)
\end{array}
\]

Therefore, \(\left(a^{m}\right)^{4}=a^{m \times 4}\)

\section*{Based on all the above we can say that \(\left(\mathbf{a}^{m}\right)^{n}=a^{m} \times a^{m} \times a^{m} \ldots . . . . n\) times \(=a^{m+m+m+\ldots n t i m e s}\)}
\[
=a^{m n}
\]

\section*{For any non-zero integer ' \(a\) ' and integers ' \(m\) ' and ' \(n\) '}
\[
\left(a^{m}\right)^{n}=a^{m n}
\]

\subsection*{11.3.3 Exponent of a product}

Example 8: Consider \(3^{5} \times 4^{5}\)
Solution: Here \(3^{5}\) and \(4^{5}\) have the same exponent 5 but different bases.
\[
\begin{aligned}
& 3^{5} \times 4^{5}=(3 \times 3 \times 3 \times 3 \times 3) \times(4 \times 4 \times 4 \times 4 \times 4) \\
& =(3 \times 4) \times(3 \times 4) \times(3 \times 4) \times(3 \times 4) \times(3 \times 4) \\
& =(3 \times 4)^{5}
\end{aligned}
\]

Therefore, \(3^{5} \times 4^{5}=(3 \times 4)^{5}\)
Example 9: Consider \(4^{4} \times 5^{4}\)
Solution: Here \(4^{4}\) and \(5^{4}\) have the same exponent 4 but have different bases.
\[
\begin{aligned}
& 4^{4} \times 5^{4}=(4 \times 4 \times 4 \times 4) \times(5 \times 5 \times 5 \times 5) \\
& =(4 \times 4 \times 4 \times 4 \times 5 \times 5 \times 5 \times 5) \\
& =(4 \times 5) \times(4 \times 5) \times(4 \times 5) \times(4 \times 5) \\
& =(4 \times 5)^{4}
\end{aligned}
\]

Therefore, \(4^{4} \times 5^{4}=(4 \times 5)^{4}\)

\section*{Example 10: Consider \(p^{7} \times q^{7}\)}

Solution: \(\quad\) Here \(p^{7}\) and \(q^{7}\) have the same exponent 7 but different bases.
\[
\begin{aligned}
p^{7} \times q^{7} & =(p \times p \times p \times p \times p \times p \times p) \times(q \times q \times q \times q \times q \times q \times q) \\
& =(p \times p \times p \times p \times p \times p \times p \times q \times q \times q \times q \times q \times q \times q) \\
& =(p \times q) \times(p \times q) \times(p \times q) \times(p \times q) \times(p \times q) \times(p \times q) \times(p \times q) \\
& =(p \times q)^{7}
\end{aligned}
\]

Therefore, \(\mathrm{p}^{7} \times \mathrm{q}^{7}=(\mathrm{p} \times \mathrm{q})^{7}\)

\section*{Based on all the above we can conclude that \(a^{m} \times b^{m}=(a \times b)^{m}=(a b)^{m}\)}

For any two non-zero integers ' \(a\) ', ' \(b\) ' and any positive integer ' \(m\) '
\[
a^{m} \times b^{m}=(a b)^{m}
\]

\section*{Do This}

Simplify the following using the law \(a^{m} \times b^{m}=(a \mathrm{~b})^{m}\)
(i) \((2 \times 3)^{4}\)
(ii) \(x^{p} \times y^{p}\)
(iii) \(a^{8} \times b^{8}\)
(iv) \((5 \times 4)^{11}\)

\subsection*{11.3.4 Division of exponents}

Before discussing division of exponents we will now discuss about negative exponents.

\subsection*{11.3.4(a) Negative exponents}

Observe the following pattern.
\begin{tabular}{|c|c|c|c|c|c|}
\hline \(2^{5}\) & & 32 & \(3^{5}\) & \(=\) & 243 \\
\hline 24 & & 16 & \(3^{4}\) & \(=\) & 81 \\
\hline \(2^{3}\) & & 8 & \(3^{3}\) & = & 27 \\
\hline & = & 4 & \(3^{2}\) & = & 9 \\
\hline \(2^{1}\) & = & 2 & \(3^{1}\) & = & 3 \\
\hline \(2^{0}\) & \(=\) & 1 & \(3^{0}\) & \(=\) & 1 \\
\hline \(2^{-1}\) & \(=\) & & \(3^{-1}\) & = & \\
\hline \multicolumn{3}{|l|}{(Hint: half of 1)} & \multicolumn{3}{|l|}{(Hint: one-third of 1)} \\
\hline \(2^{-2}\) & \(=\) & & \(3^{-2}\) & \(=\) & \\
\hline
\end{tabular}

What part of 32 is 16 ?
What is the difference between \(2^{5}\) and \(2^{4}\) ?
You will find that each time the exponent decreases by 1,the value becomes half of the previous.
From the above patterns we can say.
\(2^{-1}=\frac{1}{2}\) and \(2^{-2}=\frac{1}{4}\)
\(3^{-1}=\frac{1}{3}\) and \(\quad 3^{-2}=\frac{1}{9}\)

Furthermore, we can see that \(2^{-2}=\frac{1}{4}=\frac{1}{2^{2}}\)
similarly, \(3^{-1}=\frac{1}{3}\) and \(3^{-2}=\frac{1}{9}=\frac{1}{3^{2}}\)
For any non-zero integer ' \(a\) ' and any integer ' \(n\) '
\[
a^{-n}=\frac{1}{a^{n}}
\]

\section*{Do This}
1. Write the following, by using \(a^{-n}=\frac{1}{a^{n}}\), with positive exponents.
(i) \(x^{-7}\)
(ii) \(a^{-5}\)
(iii) \(7^{-5}\)
(iv) \(9^{-6}\)
11.3.4(b) Zero exponents

In the earlier discussion we have seen that
\(2^{0}=1\)
\(3^{0}=1\)
Similarly we can say
\(4^{0}=1\)
\(5^{0}=1\) and so on
Thus for non zero integer ' \(a\) ', \(a^{0}=1\)
11.3.4(c) Division of exponents having the same base

Example 11: Consider \(\frac{7^{7}}{7^{3}}\)

\[
=7^{4} \text { which is same as } 7^{7-3} \quad(\text { as } 7-3=4)
\]

Therefore, \(\frac{7^{7}}{7^{3}}=7^{7-3}\)
Example 12: Consider \(\frac{3^{8}}{3^{3}}\)
Solution: \(\quad \frac{3^{8}}{3^{3}}=\frac{3 \times 3 \times 3 \times 3 \times 3 \times \not \underline{p} \times \neq \neq p}{\not p \times p \times p}=3 \times 3 \times 3 \times 3 \times 3\)
\(=3^{5}\) which is same as \(3^{8-3} \quad(\) as \(8-3=5)\)
Therefore, \(\frac{3^{8}}{3^{3}}=3^{8-3}\)
Example 13: Consider \(\frac{5^{5}}{5^{8}}\)
 \(\frac{1}{5^{3}}\) which is same as \(\frac{1}{5^{8-5}} \quad(\) as \(8-5=3)\)

Therefore, \(\frac{5^{5}}{5^{8}}=\frac{1}{5^{8-5}}\)
Example 14: Consider \(\frac{a^{2}}{a^{7}}\)
Solution: \(\quad \frac{a^{2}}{a^{7}}=\frac{d \times d}{a \times a \times a \times a \times a \times d \times d}=\frac{1}{a \times a \times a \times a \times a}\)
\[
=\frac{1}{a^{5}} \text { which is the same as } \frac{1}{a^{7-2}} \quad(\text { as } 7-2=5)
\]

Therefore, \(\frac{a^{2}}{a^{7}}=\frac{1}{a^{7-2}}\)

\section*{Based on all the above examples we can say that-}
\[
\frac{a^{m}}{a^{n}}=a^{m-n} \text { if } \boldsymbol{m}>\boldsymbol{n} \text { and } \frac{a^{m}}{a^{n}}=\frac{1}{a^{n-m}} \text { if } \boldsymbol{m}<\boldsymbol{n}
\]

For any non-zero integer ' \(a\) ' and integers ' \(m\) ' and ' \(n\) '
\[
\frac{a^{m}}{a^{n}}=a^{m-n} \quad \text { if } m>n \quad \text { and } \quad \frac{a^{m}}{a^{n}}=\frac{1}{a^{n-m}} \text { if } m<n
\]

What happens when \(m=n\) ? Give your answer.
Example 15: Consider \(\frac{4^{3}}{4^{3}}\)
Solution: \(\quad \frac{4^{3}}{4^{3}}=\frac{4 \times 4 \times 4}{4 \times 4 \times 4}=\frac{1}{1}=1 \ldots\).
Also we know that \(\frac{a^{m}}{a^{n}}=a^{m-n}\)
\(\therefore \frac{4^{3}}{4^{3}}=4^{3-3}=4^{0}=1\) from (1)
Similarly, find \(\frac{7^{4}}{7^{4}}\).
What do you observe from above?
Also consider \(\frac{a^{4}}{a^{4}}=\frac{a \times a \times a \times a}{a \times a \times a \times a}=1\)

But from \(\frac{a^{m}}{a^{n}}=a^{m-n}\)

We have \(\frac{a^{4}}{a^{4}}=a^{4-4}=a^{0}=1\)

For any non zero number 'a' we have \(a^{0}=1\).
Observe here \(m, n(m=n)\)
Thus if \(\mathrm{m}=\mathrm{n} \quad \frac{a^{m}}{a^{n}}=1\)

\section*{Do This}
1. Simplify and write in the form of \(a^{m-n}\) or \(\frac{1}{a^{n-m}}\).
(i) \(\frac{13^{8}}{13^{5}}\)
(ii) \(\frac{3^{4}}{3^{14}}\)
2. Fill the appropriate number in the box.

Ex: \(\frac{8^{8}}{8^{3}}=8^{[8-3]}=8^{5}\)
(i) \(\frac{12^{12}}{12^{7}}=12 \square=12 \square\)
(ii) \(\frac{a^{18}}{a^{\square}}=a^{\square}=a^{10}\)
11.3.4(c) Dividing terms with the same exponents

Example 16: Consider \(\left(\frac{7}{4}\right)^{5}\)

Solution: \(\quad\left(\frac{7}{4}\right)^{5}=\frac{7}{4} \times \frac{7}{4} \times \frac{7}{4} \times \frac{7}{4} \times \frac{7}{4}\)
\[
\begin{aligned}
& =\frac{7 \times 7 \times 7 \times 7 \times 7}{4 \times 4 \times 4 \times 4 \times 4} \\
& =\frac{7^{5}}{4^{5}} \quad \text { (by the definition of exponent) }
\end{aligned}
\]

Therefore, \(\left(\frac{7}{4}\right)^{5}=\frac{7^{5}}{4^{5}}\)
Example 17: Consider \(\left(\frac{p}{q}\right)^{6}\)
Solution: \(\left(\frac{p}{q}\right)^{6}=\left(\frac{p}{q}\right) \times\left(\frac{p}{q}\right) \times\left(\frac{p}{q}\right) \times\left(\frac{p}{q}\right) \times\left(\frac{p}{q}\right) \times\left(\frac{p}{q}\right)\)
\(=\frac{p \times p \times p \times p \times p \times p}{q \times q \times q \times q \times q \times q}\)
\[
=\frac{p^{6}}{q^{6}} \quad \text { (By the definition of exponent) }
\]

Therefore, \(\left(\frac{p}{q}\right)^{6}=\frac{p^{6}}{q^{6}}\)
Based on the above observations we can say that.
\(\left(\frac{a}{b}\right)^{m}=\frac{a \times a \times a \times a \times \ldots \ldots \ldots \ldots \ldots \times a^{\prime} m^{\prime} \text { times }}{b \times b \times b \times b \times \ldots \ldots \ldots \ldots . \ldots \times b^{\prime} m^{\prime} \text { times }}=\frac{a^{m}}{b^{m}}\)
For any non-zero integers a, b and integer ' \(\boldsymbol{m}\) ' \(\left(\frac{a}{b}\right)^{m}=\frac{a^{m}}{b^{m}}\)

\section*{Do This}
1. Complete the following
(i) \(\left(\frac{5}{7}\right)^{3}=\frac{5^{3}}{\square}\)
(ii) \(\quad\left(\frac{3}{2}\right)^{\square}=\frac{3^{5}}{2^{5}}\)
(iii)

(iv) \(\left(\frac{x}{y}\right)^{11}=\frac{\square}{y^{11}}\)

\subsection*{11.3.5 Terms with negative base}

Example 18 : Evaluate \((1)^{4},(1)^{5},(1)^{7},(-1)^{2},(-1)^{3},(-1)^{4},(-1)^{5}\)
Solution: \(\quad(1)^{4}=1 \times 1 \times 1 \times 1=1\)
\((1)^{5}=1 \times 1 \times 1 \times 1 \times 1=1\)
\((1)^{7}=1 \times 1 \times 1 \times 1 \times 1 \times 1 \times 1=1\)
\((-1)^{2}=(-1) \times(-1)=1\)
\((-1)^{3}=(-1) \times(-1) \times(-1)=-1\)
\((-1)^{4}=(-1) \times(-1) \times(-1) \times(-1)=1\)
\((-1)^{5}=(-1) \times(-1) \times(-1) \times(-1) \times(-1)=-1\)

From the above illustrations we observe that:
(i) 1 raised to any power is 1 .
(ii) ( -1 ) raised to odd power is \((-1)\) and ( -1 ) raised to even power is \((+1)\).

Thus \((-a)^{\mathrm{m}}=-\mathrm{a}^{\mathrm{m}}\) If ' m ' is odd
\[
(-a)^{\mathrm{m}}=\mathrm{a}^{\mathrm{m}} \mathrm{If} \text { ' } \mathrm{m} \text { ' is even }
\]

Now, let us look at some more examples.
\((-3)^{4}=(-3) \quad(-3) \quad(-3) \quad(-3)=81\)
\((-a)^{4}=(-a) \quad(-a) \quad(-a) \quad(-a)=\mathrm{a}^{4}\)
\((-a)^{-3}=\frac{1}{(-a)} \times \frac{1}{(-a)} \times \frac{1}{(-a)}=\frac{1}{-a^{3}}=\frac{-1}{a^{3}}\)

Example 19: Express \(\frac{-27}{125}\) in exponential form
Solution: \(\quad-27=(-3)(-3)(-3)=(-3)^{3}\)
\(125=5 \times 5 \times 5=(5)^{3}\)

Therefore, \(\frac{-27}{125}=\frac{(-3)^{3}}{(5)^{3}} \quad\) as \(\frac{a^{m}}{b^{m}}=\left(\frac{a}{b}\right)^{m}\)
Thus, \(\frac{-27}{125}=\left(\frac{-3}{5}\right)^{3}\)

\section*{Do.This}
1. Write in expanded form.
(i) \((a)^{-5}\)
(ii) \((-a)^{4}\)
(iii) \((-7)^{-5}\)
(iv) \((-a)^{m}\)
2. Write in exponential form
(i) \((-3) \times(-3) \times(-3)\)
(ii) \((-b) \times(-b) \times(-b) \times(-b)\)
(iii) \(\frac{1}{(-2)} \times \frac{1}{(-2)} \times \frac{1}{(-2)} \ldots \ldots\). ' \(m\) ' times

\section*{Exercise - 11.2}
1. Simplify the following using laws of exponents.
(i) \(2^{10} \times 2^{4}\)
(ii) \(\left(3^{2}\right) \times\left(3^{2}\right)^{4}\)
(iii) \(\frac{5^{7}}{5^{2}}\)
(iv) \(9^{2} \times 9^{18} \times 9^{10}\)
(v) \(\left(\frac{3}{5}\right)^{4} \times\left(\frac{3}{5}\right)^{3} \times\left(\frac{3}{5}\right)^{8}\)
(vi) \((-3)^{3} \times(-3)^{10} \times(-3)^{7}\)
(vii) \(\left(3^{2}\right)^{2}\)
(viii) \(2^{4} \times 3^{4}\)
(ix) \(2^{4 a} \times 2^{5 a}\)
(x) \(\left(10^{2}\right)^{3}\)
(xi) \(\left[\left(\frac{-5}{6}\right)^{2}\right]^{5}\)
(xii) \(2^{3 a+7} \times 2^{7 a+3}\)
(xiii) \(\left(\frac{2}{3}\right)^{5}\)
(xiv) \((-3)^{3} \times(-5)^{3}\)
(xv) \(\frac{(-4)^{6}}{(-4)^{3}}\)
(xvi) \(\frac{9^{7}}{9^{15}}\)
(xvii) \(\frac{(-6)^{5}}{(-6)^{9}}\)
(xviii) \((-7)^{7} \times(-7)^{8}\)
(xix) \(\left(-6^{4}\right)^{4}\)
(xx) \(a^{x} \times a^{y} \times a^{z}\)
2. By what number should \(3^{-4}\) be multiplied so that the product is 729 ?
3. If \(5^{6} \times 5^{2 x}=5^{10}\), then find \(x\).
4. Evaluate \(2^{0}+3^{0}\)
5. \(\quad\) Simplify \(\left(\frac{x^{a}}{x^{b}}\right)^{a} \times\left(\frac{x^{b}}{x^{a}}\right)^{a} \times\left(\frac{x^{a}}{x^{a}}\right)^{b}\)
6. State true or false and justify your answer.
(i) \(100 \times 10^{11}=10^{13}\)
(ii) \(3^{2} \times 4^{3}=12^{5}\)
(iii)) \(5^{0}=(100000)^{0}\)
(iv) \(4^{3}=8^{2}\)
(v) \(2^{3}>3^{2}\)
(vi) \((-2)^{4}>(-3)^{4}\)
(vii) \((-2)^{5}>(-3)^{5}\)
Project Work

Collect the annual income particulars of any ten families in your locality and round it to the nearest thousands / lakhs and express the income of each family in the exponential form.

\subsection*{11.3.6 Expressing large numbers in standard form}

The mass of the Earth is about \(5976 \times 10^{21} \mathrm{~kg}\).
The width of the Milky Way Galaxy from one edge to the other edge is about \(946 \times 10^{5} \mathrm{~km}\).
These numbers are still not very easy to comprehend. Thus, they are often expressed in standard form. In standard form:

Mass of the Earth is about \(5.976 \times 10^{24} \mathrm{~kg}\)
Similarly, the standard form of \(946 \times 10^{15}\) is \(9.46 \times 101^{17}\).
Thus, in standard form (Scientific notation) a number is expressed as the product of largest integer exponent of 10 and a decimal number between 1 and 10.

Exercise - 11.3
Express the number appearing in the following statements in standard form.
(i) The distance between the Earth and the Moon is approximately \(384,000,000 \mathrm{~m}\).
(ii) The universe is estimated to be about \(12,000,000,000\) years old.
(iii) The distance of the sun from the center of the Milky Way Galaxy is estimated to be \(300,000,000,000,000,000,000 \mathrm{~m}\).
(iv) The earth has approximately \(1,353,000,000\) cubic km of sea water.

\section*{Looking Back}
- Very large numbers are easier to read, write and understand when expressed in exponential form.
- \(10,000=10^{4}(10\) raised to the power of 4\() ; 243=3^{5}(3\)
 raised to the power of 5); \(64=2^{6}\) ( 2 raised to the power of 6). In these examples \(10,3,2\) are the respective bases and \(4,5,6\) are the respective exponents.
- Laws of Exponents: For any non-zero integers ' \(a\) ' and ' \(b\) ' and integers ' \(m\) ' and ' \(n\) '
(i) \(a^{m} \times a^{n}=a^{m+n}\)
(ii) \(\left(a^{m}\right)^{n}=a^{m n}\)
(iii) \(a^{m} \times b^{m}=(a b)^{m}\)
(iv) \(a^{-n}=\frac{1}{a^{n}}\)
(v) \(\frac{a^{m}}{a^{n}}=a^{m-n}\) if \(m>n\)
(vi) \(\frac{a^{m}}{b^{n}}=\frac{1}{a^{n-m}}\) if \(m<n\)
(vii) \(\frac{a^{m}}{b^{m}}=\left(\frac{a}{b}\right)^{m}\)
(viii) \(\mathrm{a}^{0}=1(\) where \(\mathrm{a} \neq 0)\)
Chapter

In Class VI, we have been introduced to quadrilaterals. In this unit you will learn about the different types of quadrilaterals and their properties.

\subsection*{12.0 Quadrilateral}

What is common property among all these pictures?
(Hints: Number of sides, angles, vertices. Is it an open or closed figure?)
Thus, a quadrilateral is a closed figure with four sides, four angles and four vertices.
Quadrilateral ABCD has
(i) Four sides, namely \(\overline{\mathrm{AB}}, \overline{\mathrm{BC}}, \overline{\mathrm{CD}}\) and \(\overline{\mathrm{DA}}\)
(ii) Four vertices, namely A, B, C and D.
(iii) Four angles, namely \(\angle \mathrm{ABC}, \angle \mathrm{BCD}, \angle \mathrm{CDA}\) and \(\angle \mathrm{DAB}\).
(iv) The line segments joining the opposite vertices of a quadrilateral are called the diagonals of the quadrilateral. \(\overline{\mathrm{AC}}\) and \(\overline{\mathrm{BD}}\) are the diagonals of quadrilateral ABCD .

(v) The two sides of a quadrilateral which have a common vertex are called the 'adjacent sides' of the quadrilateral. In quadrilateral \(\mathrm{ABCD}, \overline{\mathrm{AB}}\) is adjacent to \(\overline{\mathrm{BC}}\) and B is their common vertex.
(vi) The two angles of a quadrilateral having a common side are called the pair of 'adjacent angles' of the quadrilateral. Thus, \(\angle \mathrm{ABC}\) and \(\angle \mathrm{BCD}\) are a pair of adjacent angles and \(\overline{\mathrm{BC}}\) is one of the common side.

\section*{Do This}
(i) In a quadrilateral ABCD , find the other adjacent sides and common vertices.
(ii) In a quadrilateral ABCD , find the other pairs of adjacent angles and sides.
(vii) The two sides of a quadrilateral, which do not have a common vertex, are called a pair of 'opposite sides' of the quadrilateral. Thus \(\overline{\mathrm{AB}}, \overline{\mathrm{CD}}\) and \(\overline{\mathrm{AD}}, \overline{\mathrm{BC}}\) are the two pairs of 'opposite sides' of the quadrilateral.
(viii) The two angles of a quadrilateral which do not have a common side are known as a pair of 'opposite angles' of the quadrilateral. Thus \(\angle \mathrm{DAB}, \angle \mathrm{BCD}\) and \(\angle \mathrm{CDA}, \angle \mathrm{ABC}\) are the two pairs of opposite angles of the quadrilateral.

\section*{Try This}

How many different quadrilaterals can be obtained from the adjacent figure? Name them.

\subsection*{12.1 Interior-Exterior points of a quadrilateral}

In quadrilateral ABCD which points lie inside the quadrilateral?
Which points lie outside the quadrilateral?
Which points lie on the quadrilateral?

Points P and M lie in the interior of the quadrilateral. Points \(\mathrm{L}, \mathrm{O}\) and Q lie in the exterior of the quadrilateral. Points \(\mathrm{N}, \mathrm{A}, \mathrm{B}, \mathrm{C}\) and D lie on the quadrilateral.

Mark as many points as you can in the interior of the quadrilateral.
Mark as many points as you can in the exterior of the quadrilateral.
How many points, do you think will be there in the interior of the quadrilateral?

\subsection*{12.2 Convex and Concave quadrilateral}

Mark any two points L and M in the interior of quadrilateral ABCD and join them. The line segment joining these two points fall in the interior of quadrilateral.

Does the line segment or a part of it joining these points lie in the exterior of the quadrilateral? Can you find any two points in the interior of the quadrilateral ABCD for which the line segment joining them falls in the exterior of the quadrilateral?

You will see that this is not possible.
Now let us do similar work in quadrilateral PQRS .

Figure 1

Mark any two points U and V in the interior of quadrilateral PQRS and join them. Does the line segment joining these two points fall in the exterior of the quadrilateral? Can you make more line segments like these in quadrilateral PQRS.
Can you also make line segments, joining two points, which lie in the interior of the quadrilateral PQRS . You will find that this is possible too.

\section*{Quadrilateral \(A B C D\) is said to be a convex quadrilateral if all line segments joining points in the interior of the quadrilateral also lie in interior of the quadrilateral.}

Quadrilateral PQRS is said to be a concave quadrilateral if all line segment joining points in the interior of the quadrilateral do not necessarily lie in the interior of the quadrilateral.

\section*{Try This}
1.

(i) Is quadrilateral EFGH a convex quadrilateral?

(ii) Is quadrilateral TUVW a concave quadrilateral?
(iii) Draw both the diagonals for quadrilateral EFGH. Do they intersect each other?
(iv) Draw both the diagonals for quadrilateral TUVW. Do they intersect each other?

You will find that the digonals of a convex quadrilateral intersect each other in the interior of the quadrilateral and the diagonals of a concave quadrialteral intersect each other in the exterior of the quadrilateral.

\subsection*{12.3 Angle-sum property of a quadrilateral}

\section*{Activity 1}

Take a piece of cardboard. Draw a quadrilateral ABCD on it. Make a cut of it. Then cut quadrilateral into four pieces (Figure 1) and arrange them as shown in the Figure 2, so that all angles \(\angle 1, \angle 2, \angle 3, \angle 4\) meet at a point.

Figure 2

Is the sum of the angles \(\angle 1, \angle 2, \angle 3\) and \(\angle 4\) equal to \(360^{\circ}\) ? (sum of angles at a point)

\section*{The sum of the four angles of a quadrilateral is \(360^{\circ}\).}
[Note: We can also denote the angles \(\angle 1, \angle 2, \angle 3\), etc. by as their respective measures i.e. \(\mathrm{m} \angle 1\), \(\mathrm{m} \angle 2, \mathrm{~m} \angle 3\), etc.]

You may arrive at this result in several other ways also.
1. Let P be any point in the interior of quadrilateral \(A B C D\). Join \(P\) to vertices \(A, B, C\) and \(D\). In the figure, consider \(\triangle \mathrm{PAD}\).
\(\mathrm{m} \angle 2+\mathrm{m} \angle 3=180^{\circ}-x\)
Similarly, in \(\triangle \mathrm{PDC}, \mathrm{m} \angle 4+\mathrm{m} \angle 5=180^{\circ}-\mathrm{y}\)
in \(\triangle \mathrm{PCB}, \mathrm{m} \angle 6+\mathrm{m} \angle 7=180^{\circ}-\mathrm{z}\) and
in \(\triangle \mathrm{PBA}, \mathrm{m} \angle 8+\mathrm{m} \angle 1=180^{\circ}-\mathrm{w}\).

(angle-sum property of a triangle)
Adding (1), (2), (3) and (4) we get
\(\mathrm{m} \angle 1+\mathrm{m} \angle 2+\mathrm{m} \angle 3+\mathrm{m} \angle 4+\mathrm{m} \angle 5+\mathrm{m} \angle 6+\mathrm{m} \angle 7+\mathrm{m} \angle 8\)
\[
\begin{aligned}
& =180^{\circ}-x+180^{\circ}-y+180^{\circ}-\mathrm{z}+180^{\circ}-\mathrm{w} \\
& =720^{\circ}-(x+y+\mathrm{z}+\mathrm{w}) \\
& \left(x+y+\mathrm{z}+\mathrm{w}=360^{\circ} ; \text { sum of angles at a point }\right) \\
& =720^{\circ}-360^{\circ} \quad=360^{\circ}
\end{aligned}
\]

Thus, the sum of the angles of the quadrilateral is \(360^{\circ}\).
2. Take any quadrilateral, say ABCD . Divide it into two triangles, by drawing a diagonal. You get six angles 1, 2, 3, 4, 5 and 6.

Using the angle-sum property of a triangle and you can easily find how the sum of the measures of \(\angle \mathrm{A}, \angle \mathrm{B}, \angle \mathrm{C}\) and \(\angle \mathrm{D}\) amounts to \(360^{\circ}\).

\section*{\(\stackrel{Q}{9}\) \\ Try This}

What would happen if the quadrilateral is not convex? Consider quadrilateral \(A B C D\). Split it into two triangles and find the sum of the interior angles. What is the sum of interior angles of a concave quadrilateral?

Example 1: The three angles of a quadrilateral are \(55^{\circ}, 65^{\circ}\) and \(105^{\circ}\). Find the fourth angle?
Solution : \(\quad\) The sum of the four angles of a quadrilateral \(=360^{\circ}\).
The sum of the given three angles \(\quad=55^{\circ}+65^{\circ}+105^{\circ}=225^{\circ}\)
Therefore, the fourth angle \(\quad=360^{\circ}-225^{\circ}=135^{\circ}\)
Example 2: In a quadrilateral, two angles are \(80^{\circ}\) and \(120^{\circ}\). The remaining two angles are equal. What is the measure of each of these angles?

Solution : The sum of the four angles of the quadrilateral \(=360^{\circ}\).
Sum of the given two angles \(=80^{\circ}+120^{\circ}=200^{\circ}\)
Therefore, the sum of the remaining two angles \(=360^{\circ}-200^{\circ}=160^{\circ}\)
Both these angles are equal.
Therefore, each angle \(=160^{\circ} \div 2=80^{\circ}\)
Example 3: The angles of a quadrilateral are \(x^{\circ},(x-10)^{\circ},(x+30)^{\circ}\) and \(2 x^{\circ}\). Find the angles.
Solution: \(\quad\) The sum of the four angles of a quadrilateral \(=360^{\circ}\)
Therefore, \(x+(x-10)+(x+30)+2 x=360\)
\[
\begin{aligned}
5 x+20 & =360 \\
\therefore \quad x & =68^{\circ}
\end{aligned}
\]

Thus, the four angles are \(=68^{\circ} ;(68-10)^{\circ} ;(68+30)^{\circ} ;(2 \times 68)^{\circ}\)
\[
=68^{\circ}, 58^{\circ}, 98^{\circ} \text { and } 136^{\circ} .
\]

Example 4: The angles of a quadrilateral are in the ratio \(3: 4: 5: 6\). Find the angles.
Solution : The sum of four angles of a quadrilateral \(=360^{\circ}\)
The ratio of the angles is \(3: 4: 5: 6\)
Thus, the angles are \(3 x, 4 x, 5 x\) and \(6 x\).
\[
\begin{aligned}
3 x+4 x+5 x+6 x & =360^{\circ} \\
18 x & =360^{\circ} \\
x & =\frac{360}{18}=20^{\circ}
\end{aligned}
\]

Thus, the angles are \(=3 \times 20^{\circ} ; 4 \times 20^{\circ} ; 5 \times 20^{\circ} ; 6 \times 20^{\circ}\)
\[
=60^{\circ}, 80^{\circ}, 100^{\circ} \text { and } 120^{\circ}
\]
1. In quadrilateral PQRS
(i) Name the sides, angles, vertices and diagonals.
(ii) Also name all the pairs of adjacent sides, adjacent angles,
 opposite sides and opposite angles.
2. The three angles of a quadrilateral are \(60^{\circ}, 80^{\circ}\) and \(120^{\circ}\). Find the fourth angle?

3. The angles of a quadrilateral are in the ratio \(2: 3: 4: 6\). Find the measure of each of the four angles.
4. The four angles of a quadrilateral are equal. Find each of them. Draw this quadrilateral in your notebook.
5. In a quadrilateral, the angles are \(x^{\circ},(x+10)^{\circ},(x+20)^{\circ},(x+30)^{\circ}\). Find the angles.
6. The angles of a quadrilateral cannot be in the ratio \(1: 2: 3: 6\). Why? Give reasons.
(Hint: Try to draw a rough diagram of this quadrilateral)

\subsection*{12.4 Types of quadrilaterals}

Based on the nature of the sides and angles, quadrilaterals have different names.

\subsection*{12.4.1 Trapezium}

\section*{Trapezium is a quadrilateral with one pair of parallel sides.}

These are trapeziums

These are not trapeziums
(Note: The arrow marks indicate parallel lines).
Why the second set of figures are not trapeziums?

\subsection*{12.4.2 Kite}

A Kite is a special type of quadrilateral. The sides with the same markings in each figure are equal in length. For example \(A B=A D\) and \(B C=C D\).

These are kites

These are not kites

Why the second set of figures are not kites?
Observe that:
(i) A kite has \(\mathbf{4}\) sides (It is a convex quadrilateral).
(ii) There are exactly two distinct, consecutive pairs of sides of equal length.

\section*{Activity 2}

Take a thick sheet of paper. Fold the paper at the centre. Draw two line segments of different lengths as shown in Figure 1. Cut along the line segments and open up the piece of paper as shown in Figure 2.

You have the shape of a kite.

Figure 1

Figure 2

Does the kite have line symmetry?
Fold both the diagonals of the kite. Use the set-square to check if they cut at right angles.
Are the diagonals of the kite equal in length? Verify (by paper-folding or measurement) if the diagonals bisect each other.

\subsection*{12.4.3 Parallelogram}

\section*{Activity 3}

Take two identical cut-outs of a triangle of sides \(3 \mathrm{~cm}, 4 \mathrm{~cm}, 5 \mathrm{~cm}\).
Arrange them as shown in the figure given below:

You get a parallelogram. Which are the parallel sides here? Are the parallel sides equal? You can get two more parallelograms using the same set of triangles. Find them out.

\section*{A parallelogram is a quadrilateral with two pairs of opposite sides parallel.}

\section*{Activity 4}

Take a ruler. Place it on a paper and draw two lines along its two sides as shown in Figure1. Then place the ruler over the lines as shown in Figure2 and draw two more lines along its edges again.

Figure 1

Figure 2

Figure 3

In Figure 3, opposite sides are parallel, hence it is a parallelogram.

\subsection*{12.4.3(a) Properties of a parallelogram}

Sides of parallelogram

\section*{Activity 5}

Take cut-outs of two identical parallelograms, say ABCD and \(\mathrm{A}^{1} \mathrm{~B}^{1} \mathrm{C}^{1} \mathrm{D}^{1}\) with two different colours.

Here \(\overline{\mathrm{AB}}\) is same as \(\overline{\mathrm{A}^{\prime} \mathrm{B}^{\prime}}\) except for the name. Similarly, the other corresponding sides are equal too. Place \(\overline{\mathrm{A}^{\prime} \mathrm{B}^{\prime}}\) over \(\overline{\mathrm{DC}}\). Do they coincide? Are the lengths \(\overline{\mathrm{A}^{\prime} \mathrm{B}^{\prime}}\) and \(\overline{\mathrm{DC}}\) equal?

Similarly examine the lengths \(\overline{\mathrm{AD}}\) and \(\overline{\mathrm{B}^{\prime} \mathrm{C}^{\prime}}\). What do you find?
You will find that the sides are equal in both cases. Thus, the opposite sides of a parallelogram are of equal length.

You will also find the same results by measuring the side of the parallelogram with a scale.

\section*{Try This}

Take two identical set squares with angles \(30^{\circ}-\) \(60^{\circ}-90^{\circ}\) and place them adjacently as shown in the adjacent figure. Does this help you to verify the above property? (Can we say every rectangle is a parallelogram?)

Example 5: Find the perimeter of the parallelogram PQRS .
Solution : In a parallelogram, the opposite sides have same length.
According to the question, \(\mathrm{PQ}=\mathrm{SR}=12 \mathrm{~cm}\) and \(\mathrm{QR}=\mathrm{PS}=7 \mathrm{~cm}\)
\[
\text { Thus, } \begin{aligned}
\text { Perimeter } & =\mathrm{PQ}+\mathrm{QR}+\mathrm{RS}+\mathrm{SP} \\
& =12 \mathrm{~cm}+7 \mathrm{~cm}+12 \mathrm{~cm}+7 \mathrm{~cm}=38 \mathrm{~cm}
\end{aligned}
\]

\section*{Angles of a parallelogram}

\section*{Activity 6}

Let ABCD be a parallelogram. Copy it on a tracing sheet. Name this copy as \(\mathrm{A}^{\prime}, \mathrm{B}^{\prime}, \mathrm{C}^{\prime}, \mathrm{D}^{\prime}\). Place \(\mathrm{A}^{\prime}, \mathrm{B}^{\prime}, \mathrm{C}^{\prime}, \mathrm{D}^{\prime}\) on ABCD as shown in Figure 1. Pin them together at the point where the diagonals meet. Rotate the transparent sheet by \(90^{\circ}\) as shown in Figure 2. Then rotate the parallelogram again by \(90^{\circ}\) in the same direction. You will find that the parallelograms coincide as shown in Figure 3. You now find \(A^{\prime}\) lying exactly on \(C\) and \(C^{\prime}\) lying on \(A\). Similarly \(B^{\prime}\) lies on \(D\) and \(D^{\prime}\) lies on \(B\) as shown in Figure 3.

Figure 1

Figure 3

Does this tell you anything about the measures of the angles A and C? Examine the same for angles B and D. State your findings.

You will conclude that the opposite angles of a parallelogram are of equal measure.

\section*{Try This}

Take two identical \(30^{\circ}-60^{\circ}-90^{\circ}\) set squares and form a parallelogram as before.
Does the figure obtained help you confirm the above property?

\section*{You can justify this idea through logical arguments-}

If \(\overline{\mathrm{AC}}\) and \(\overline{\mathrm{BD}}\) are the diagonals of the parallelogram ABCD you find that \(\angle 1=\angle 2\) and \(\angle 3=\angle 4\) (alternate angles property)
\(\Delta \mathrm{ABC} \cong \triangle \mathrm{CDA}\) (ASA congruency).
Therefore, \(\mathrm{m} \angle \mathrm{B}=\mathrm{m} \angle \mathrm{D}\) (c.p.c.t.).
Similarly, \(\triangle \mathrm{ABD} \cong \triangle \mathrm{CDB}\), therefore, \(\mathrm{m} \angle \mathrm{A}=\mathrm{m} \angle \mathrm{C}\). (c.p.c.t.).
Thus, the opposite angles of a parallelogram are of equal measure.

\section*{We now turn our attention to adjacent angles of a parallelogram.}

In parallelogram \(\mathrm{ABCD}, \overline{\mathrm{DC}} \| \overline{\mathrm{AB}}\) and \(\overline{\mathrm{DA}}\) is the transversal.
Therefore, \(\angle \mathrm{A}\) and \(\angle \mathrm{D}\) are the interior angles on the same side of the transversal. They are supplementary each other.
\(\angle \mathrm{A}\) and \(\angle \mathrm{B}\) are also supplementary. Can you say 'why'?
\(\overline{\mathrm{AD}} \| \overline{\mathrm{BC}}\) and \(\overline{\mathrm{BA}}\) is a transversal, making \(\angle \mathrm{A}\) and \(\angle \mathrm{B}\) interior
 angles.

\section*{Do This}

Identify two more pairs of supplementary angles from the parallelogram ABCD given above.

Example 6: BEST is a parallelogram. Find the values \(x, y\) and \(z\).
Solution: \(\quad \angle \mathrm{S}\) is opposite to \(\angle \mathrm{B}\).
So, \(\quad x=100^{\circ}\) (opposite angles property)
\(y=100^{\circ}\) (corresponding angles)
\(z=80^{\circ}\) (since \(\angle y, \angle z\) is a linear pair)

The adjacent angles in a parallelogram are supplementary. You have observed the same result in the previous example.

Example 7: In parallelogram \(\operatorname{RING}\) if \(\mathrm{m} \angle \mathrm{R}=70^{\circ}\), find all the other angles.

Solution: According to the question, \(\mathrm{m} \angle \mathrm{R}=70^{\circ}\)
Then \(\mathrm{m} \angle \mathrm{N}=70^{\circ}\) (opposite angles of a parallelogram)
Since \(\angle \mathrm{R}\) and \(\angle \mathrm{I}\) are supplementary angles,

\(\mathrm{m} \angle \mathrm{I}=180^{\circ}-70^{\circ}=110^{\circ}\)
Also, \(\mathrm{m} \angle \mathrm{G}=110^{\circ}\) since \(\angle \mathrm{G}\) and \(\angle \mathrm{I}\) are opposite angles of a parallelogram.
Thus, \(\mathrm{m} \angle \mathrm{R}=\mathrm{m} \angle \mathrm{N}=70^{\circ}\) and \(\mathrm{m} \angle \mathrm{I}=\mathrm{m} \angle \mathrm{G}=110^{\circ}\)

\section*{Try This}

For the above example, can you find \(\mathrm{m} \angle \mathrm{I}\) and \(\mathrm{m} \angle \mathrm{G}\) by any other method?
Hint : Angle-sum property of a quadrilateral.

\subsection*{12.4.3 (b) Diagonals of parallelogarm}

\section*{Activity 7}

Take a cut-out of a parallelogram, say, ABCD . Let its diagonals \(\overline{\mathrm{AC}}\) and \(\overline{\mathrm{DB}}\) meet at O .

Find the mid-point of \(\overline{\mathrm{AC}}\) by folding and placing C on A . Is the mid-point same as O ?

Find the mid-point of \(\overline{\mathrm{DB}}\) by folding and placing D on B . Is the mid-point same as O ?

Does this show that diagonal \(\overline{\mathrm{DB}}\) bisects the diagonal \(\overline{\mathrm{AC}}\) at the point O ? Discuss it with your friends. Repeat the activity to find where the mid point of \(\overline{\mathrm{DB}}\) could lie.

\section*{The diagonals of a parallelogram bisect each other. \\ It is not very difficult to justify this property using ASA congurency:}

\(\Delta \mathrm{AOB} \cong \Delta \mathrm{COD}\) (How is ASA used here?)
This gives \(\overline{\mathrm{AO}}=\overline{\mathrm{CO}}\) and \(\overline{\mathrm{BO}}=\overline{\mathrm{DO}}\)

Example 8: HELP is a parallelogram. Given that \(\overline{\mathrm{OE}}=4 \mathrm{~cm}\), where O is the point of intersection of the diagonals and \(\overline{\mathrm{HL}}\) is 5 cm more than \(\overline{\mathrm{PE}}\) ? Find \(\overline{\mathrm{OH}}\).

Solution: If \(\overline{\mathrm{OE}}=4 \mathrm{~cm}\) then \(\overline{\mathrm{OP}}\) also is 4 cm (Why?)
So \(\overline{\mathrm{PE}}=8 \mathrm{~cm} \quad\) (Why?)
HL is 5 cm more than \(\overline{\mathrm{PE}}\)

Therefore, \(\quad \overline{\mathrm{HL}}=8+5=13 \mathrm{~cm}\)

Thus,
\[
\overline{\mathrm{OH}}=\frac{1}{2} \times 13=6.5 \mathrm{cms}
\]

\subsection*{12.4.4 Rhombus}

Recall the paper-cut kite you made earlier. When you cut along ABC and opened up, you got a kite. Here lengths \(A B\) and \(B C\) were different. If you draw \(\mathrm{AB}=\mathrm{BC}\), then the kite you obtain is called a rhombus.

Note that all the sides of rhombus are of same length; this is not the case with the kite.

Since the opposite sides of a rhombus are parallel, it is also a parallelogram.

Rhombus-cut

So, a rhombus has all the properties of a parallelogram and also that of a kite. Try to list them out. You can then verify your list with the check list at the end of the chapter.

Kite

Rhombus

The diagonals of a rhombus are perpendicular bisectors of one another

\section*{Activity 8}

Take a copy of a rhombus. By paper-folding verify if the point of intersection is the mid-point of each diagonal. You may also check if they intersect at right angles, using the corner of a set-square.

Now let us justify this property using logical steps.
ABCD is a rhombus. It is a parallelogram too, so diagonals bisect each other.
Therefore, \(\overline{\mathrm{OA}}=\overline{\mathrm{OC}}\) and \(\overline{\mathrm{OB}}=\overline{\mathrm{OD}}\).

We now have to show that \(\mathrm{m} \angle \mathrm{AOD}=\mathrm{m} \angle \mathrm{COD}=90^{\circ}\).
It can be seen that by SSS congruency criterion.
\(\Delta \mathrm{AOD} \cong \triangle \mathrm{COD}\)
Therefore,\(\quad \mathrm{m} \angle \mathrm{AOD}=\mathrm{m} \angle \mathrm{COD}\)

Since \(\angle \mathrm{AOD}\) and \(\angle \mathrm{COD}\) are a linear pair,
\[
\mathrm{m} \angle \mathrm{AOD}=\mathrm{m} \angle \mathrm{COD}=90^{\circ}
\]

We conclude, the diagonals of a rhombus are perpendicular bisectors of each other.

\subsection*{12.4.5 Rectangle}

A rectangle is a parallelogram with equal angles.
What is the full meaning of this definition? Discuss with your friends.
If the rectangle is to be equiangular, what could be the measure of each angle?
Let the measure of each angle be \(x^{\circ}\).
Then
\[
4 x^{\circ}=360^{\circ} \quad(\text { Why }) ?
\]

Therefore,
\[
x^{\circ}=90^{\circ}
\]

Thus, each angle of a rectangle is a right angle.
So, a rectangle is a parallelogram in which every angle is a right angle.
Being a parallelogram, the rectangle has opposite sides of equal length and its diagonals bisect each other.

In a parallelogram, the diagonals can be of different lengths. (Check this); but surprisingly the rectangle (being a special case) has diagonals of equal length.

This is easy to justify:
If \(A B C D\) is a rectangle,
\[
\Delta \mathrm{ABC} \cong \triangle \mathrm{BAD}
\]

This is because \(\overline{\mathrm{AB}}=\overline{\mathrm{AB}} \quad\) (Common side)

\[
\begin{array}{ll}
\overline{\mathrm{BC}}=\overline{\mathrm{AD}} & (\text { Why? }) \\
\mathrm{m} \angle \mathrm{~A}=\mathrm{m} \angle \mathrm{~B}=90^{\circ} & (\text { Why? })
\end{array}
\]

Thus, by SAS criterion \(\triangle \mathrm{ABC} \cong \triangle \mathrm{BAD}\) and \(\overline{\mathrm{AC}}=\overline{\mathrm{BD}}\) (c.p.c.t.)
Thus, in a rectangle the diagonals are of equal length.

Example 9: RENT is a rectangle. Its diagonals intersect at O. Find \(x\), if \(\overline{\mathrm{OR}}=2 x+4\) and \(\overline{\mathrm{OT}}=3 x+1\).
Solution: \(\quad \overline{\mathrm{OT}}\) is half of the diagonal \(\overline{\mathrm{TE}}\) and \(\overline{\mathrm{OR}}\) is half of the diagonal RN.

Diagonals are equal here. (Why?)
So, their halves are also equal.

Therefore \(\quad 3 x+1=2 x+4\)
or \(\quad x=3\)

\subsection*{12.4.6 Square}

A square is a rectangle with equal adjacent sides.
This means a square has all the properties of a rectangle with an additional property that all the sides have equal length.

The square, like the rectangle, has diagonals of equal length.
In a rectangle, there is no requirement for the diagonals to be perpendicular to one another (Check this). However, this is not true for a square.

\section*{Let us justify this-}

BELT is a square, therefore, \(\mathrm{BE}=\mathrm{EL}=\mathrm{LT}=\mathrm{TB}\)
Now, let us consider \(\triangle \mathrm{BOE}\) and \(\triangle \mathrm{LOE}\)
\(\mathrm{OB}=\mathrm{OL}\) (why?)
OE is common

Thus, by SSS congruency \(\triangle \mathrm{BOE} \cong \triangle \mathrm{LOE}\)
So \(\angle \mathrm{BOE}=\angle \mathrm{LOE}\)
but \(\quad \angle \mathrm{BOE}+\angle \mathrm{LOE}=180^{\circ}\) (why?)
\[
\angle \mathrm{BOE}=\angle \mathrm{LOE}=\frac{180}{2}=90^{\circ}
\]

Thus, the diagonals of a square are perpendicular bisectors of each other.

\section*{In a square the diagonals.}
(i) bisect one another (square being a rectangle)
(ii) are of equal length (square being a rectangle) and
(iii) are perpendicular to one another.

\subsection*{12.5 Making figures with a tangram.}

Use all the pieces of tangarm to form a trapezium, a parallelogram, a rectangle and a square.

Also make as many different kinds of figures as you can by using all the pieces. Two examples have been given for you.

Example 10: In trapezium \(\mathrm{ABCD}, \mathrm{AB}\) is parallel to CD . If \(\angle A=50^{\circ}, \angle B=70^{\circ}\). Find \(\angle \mathrm{C}\) and \(\angle \mathrm{D}\).

\section*{Solution: Since \(A B\) is parallel to \(C D\)}

\(\angle \mathrm{A}+\angle \mathrm{D}=180^{\circ}\) (interior angles on the same side of the transversal)
So \(\angle \mathrm{D}=180^{\circ}-50^{\circ}=130^{\circ}\)
Similarly, \(\quad \angle \mathrm{B}+\angle \mathrm{C}=180^{\circ}\)
\[
\text { So } \angle \mathrm{C}=180^{\circ}-70^{\circ}=110^{\circ}
\]

Example 11: The measures of two adjacent angles of a parallelogram are in the ratio \(3: 2\). Find the angles of the parallelogram.

Solution: The adjacent angles of a parallelogram are supplementary.
i.e. their sum \(=180^{\circ}\)

Ratio of adjacent angles \(=3: 2\)
So, each of the angles is \(180 \times \frac{3}{5}=108^{\circ}\) and
\(180 \times \frac{2}{5}=72^{\circ}\)
Example 12: RICE is a rhombus. Diagonals intersect at 'O'. Find OE and OR. Justify your findings.

Solution: Diagonals of a rhombus bisect each other
 i.e., \(\mathrm{OE}=\mathrm{OI}\) and \(\mathrm{OR}=\mathrm{OC}\)

Therefore, \(\mathrm{OE}=5\) and \(\mathrm{OR}=12\)

Exercise - 12.2
1. State whether true or false-
(i) All rectangles are squares
(ii) All rhombuses are parallelogram
(iii) All squares are rhombuses and also rectangles
(iv) All squares are not parallelograms
(v) All kites are rhombuses
(vi) Allrhombuses are kites
(vii) All parallelograms are trapeziums
(viii) All squares are trapeziums
2. Explain how a square is a-
(i) quadrilateral
(ii) parallelogram
(iii) rhombus
(iv) rectangle.
3. In a rhombus \(\mathrm{ABCD}, \angle \mathrm{ABC}=40^{\circ}\).

Find the other angles.

4. The adjacent angles of a parallelogram are \(x^{\circ}\) and \((2 x+30)^{\circ}\). Find all the angles of the parallelogram.
5. Explain how DEAR is a trapezium. Which of its two sides are parallel?

6. BASE is a rectangle. Its diagonals intersect at O . Find \(x\), if \(\mathrm{OB}=5 x+1\) and \(\mathrm{OE}=2 x+4\).

7. Is quadrilateral ABCD a parallelogram, if \(\angle \mathrm{A}=70^{\circ}\) and \(\angle \mathrm{C}=65^{\circ}\) ? Give reason.
8. Two adjacent sides of a parallelogram are in the ratio 5:3 the perimeter of the parallelogram is 48 cm . Find the length of each of its sides.
9. The diagonals of the quadrilateral are perpendicular to each other. Is such a quadrilateral always a rhombus? Draw a rough figure to justify your answer.
10. ABCD is a trapezium in which \(\overline{\mathrm{AB}} \| \overline{\mathrm{DC}}\). If \(\angle \mathrm{A}=\angle \mathrm{B}=30^{\circ}\), what are the measures of the other two angles?
11. Fill in the blanks.
(i) A parallelogramin which two adjacent sides are equal is a \(\qquad\) .
(ii) A parallelogram in which one angle is \(90^{\circ}\) and two adjacent sides are equal is a
\(\qquad\)
(iii) In trapezium \(\mathrm{ABCD}, \overline{\mathrm{AB}} \| \overline{\mathrm{DC}}\). If \(\angle \mathrm{D}=x^{\circ}\) then \(\angle \mathrm{A}=\) \(\qquad\) .
(iv) Every diagonal in a parallelogram divides it in to \(\qquad\) triangles.
(v) In parallelogram ABCD , its diagonals \(\overline{\mathrm{AC}}\) and \(\overline{\mathrm{BD}}\) intersect at O . If \(\mathrm{AO}=5 \mathrm{~cm}\) then \(\mathrm{AC}=\) \(\qquad\) cm .
(vi) In a rhombus ABCD , its diagonals intersect at ' O '. Then \(\angle \mathrm{AOB}=\) degrees.
(vii) ABCD is a parallelogram then \(\angle \mathrm{A}-\angle \mathrm{C}=\) \(\qquad\) degrees.
(viii) In a rectangle ABCD , the diagonal \(\mathrm{AC}=10 \mathrm{~cm}\) then the diagonal \(\mathrm{BD}=\) \(\qquad\) cm.
(ix) In a square ABCD , the diagonal \(\overline{\mathrm{AC}}\) is drawn. Then \(\angle \mathrm{BAC}=\) \(\qquad\) degrees.

\section*{Looking back}
1. A simple closed figure bounded by four line segments is called a quadrilateral.
2. Every quadrilateral divides a plane into three parts interior,
 exterior and the quadrilateral.
3. Every quadrilateral has a pair of diagonals.
4. If the diagonals lie in the interior of the quadrilateral it is called convex quadriateral.
5. If any one of the diagonals is not in the interior of the quadrilateral it is called a concave Quadrilateral.
6. The sum of interior angles of a quadrilateral is equal to \(360^{\circ}\).
7. Properties of Quadrilateral
\begin{tabular}{|c|c|}
\hline Quadrilateral & Properties \\
\hline Parallelogram : Aquadrilateral with both pair, of opposite sides parallel & \begin{tabular}{l}
(1) Opposite sides are equal. \\
(2) Opposite angles are equal. \\
(3) Diagonals bisect one another.
\end{tabular} \\
\hline Rhombus : Aparallelogram with all sides of equal length. & \begin{tabular}{l}
(1) All the properties of a parallelogram. \\
(2) Diagonals are perpendicular to each other.
\end{tabular} \\
\hline Rectangle : A parallelogram with all right angles. & \begin{tabular}{l}
(1) All the properties of a parallelogram. \\
(2) Each of the angles is a right angle. \\
(3) Diagonals are equal.
\end{tabular} \\
\hline Square : Arectangle with sides of equal length. & (1) All the properties of a parallelogram, rhombus and a rectangle \\
\hline Kite : A quadrilateral with exactly two pairs of equal consecutive sides. & \begin{tabular}{l}
(1) The diagonals are perpendicular to one another. \\
(2) The diagonals are not of equal length. \\
(3) One of the diagonals bisects the other.
\end{tabular} \\
\hline Trapezium: Aquadrilateral with one pair of parallel sides. & 1) One pair of opposite sides are parallel. \\
\hline
\end{tabular}

\subsection*{13.0 Introduction}

Ira wants to find the area of her agricultural land, which is irregular in shape (Figure 1). So she divided her land into some regular shapes- triangles, rectangle, parallelogram, rhombus and square (Figure 2). She thought, 'if I know the area of all these parts, I will know the area of my land.'

Figure 1

Figure 2

We have learnt how to find the perimeter and area of a rectangle and square in earlier classes. In this chapter we will learn how to find the area of a parallelogram, triangle, rhombus. First let us review what we have learnt about the area and perimeter of a square and rectangle in earlier classes.

Exercise - 13.1
1. Complete the table given below.

2. The measurements of some squares are given in the table below. However, they are incomplete. Find the missing information.
\begin{tabular}{|c|c|c|}
\hline Side of a square & Area & Perimeter \\
\hline 15 cm & \(225 \mathrm{~cm}^{2}\) & \\
\hline & & 88 cm \\
\hline
\end{tabular}
3. The measurements of some rectangles are given in the table below. However, they are incomplete. Find the missing information.
\begin{tabular}{|c|c|c|c|}
\hline Length & Breadth & Area & Perimeter \\
\hline 20 cm & 14 cm & & \\
\hline & 12 cm & & 60 cm \\
\hline 15 cm & & \(150 \mathrm{~cm}^{2}\) & \\
\hline
\end{tabular}

\subsection*{13.1 Area of a parallelogram}

Look at the shape in Figure 1. It is a parallelogram. Now let us learn how to find its area-

\section*{Activity 1}

Figure 1
- Draw a parallelogram on a sheet of paper (Figure 2).
- Cut out the parallelogram.
- Now cut the parallelogram along the dotted line as shown in Figure 2 and separate the triangular shaped piece of paper.

Figure 2
- Keep the triangle on the other side as shown in Figure 3 and see if both the pieces together form a rectangle.

Figure 3

Can we say that the area of the parallelogram in Figure 2 equal to the area of the rectangle in Figure 3? You will find this to be true.

As you can see from the above activity the area of the parallelogram is equal to the area of the rectangle.

We know that the area of the rectangle is equal to length \(\times\) breadth. We also know that the length of the rectangle is equal to the base of the parallelogram and the breadth of the rectangle is equal to its height.

Therefore, Area of parallelogram = Area of rectangle

\[
\begin{aligned}
& =\text { length } \times \text { breadth } \\
& =\text { base } \times \text { height } \quad(\text { length }=\text { base } ; \text { breadth }=\text { height })
\end{aligned}
\]

Thus, the area of the parallelogram is equal to the product of its base (b) and corresponding height (h) i.e., A = bh

Example 1: Find the area of each parallelogram givenin Figure 1 and Figure 2.
(i)

(ii)

\section*{Solution :}

Base of a parallelogram \((b)=6 \mathrm{~m}\).
Height of a parallelogram \((\mathrm{h})=13 \mathrm{~m}\).
Area of a parallelogram \((\mathrm{A})=\mathrm{bh}\)
Therefore, \(A=6 \times 13=78 \mathrm{~m}^{2}\)
Thus, area of parallelogram \(A B C D\) is \(78 \mathrm{~m}^{2}\)

Figure 2

\section*{Try This}

ABCD is a parallelogram with sides 8 cm and 6 cm . In Figure 1, what is the base of the parallelogram? What is the height? What is the area of the parallelogram?
In Figure 2, what is the base of the parallelogram? What is the height? What is the area of the parallelogram? Is the area of Figure 1 and Figure 2 the same?

Figure 1

Figure 2

Any side of a parallelogram can be chosen as base of the parallelogram. In Figure 1, DE is the perpendicular falling on \(A B\). Hence \(A B\) is the base and \(D E\) is the height of the parallelogram. In Figure 2, BF is the perpendicular falling on side AD . Hence, AD is the base and BF is
 the height.

\section*{Do This}
1. In parallelogram \(\mathrm{ABCD}, \mathrm{AB}=10 \mathrm{~cm}\) and \(\mathrm{DE}=4 \mathrm{~cm}\).

Find (i) The area of ABCD .
(ii) The length of BF , if \(\mathrm{AD}=6 \mathrm{~cm}\)

2. Carefully observe the following parallelograms.

(i) Find the area of each parallelogram by counting the squares enclosed in it. For counting incomplete squares check whether two incomplete squares make a complete square in each parallelogram.

Complete the following table accordingly.
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline \multirow{2}{*}{ Parallelogram } & \multirow{2}{*}{ Base } & \multirow{2}{*}{ Height } & \multirow{3}{*}{ Area } & \multicolumn{3}{|c|}{ Area by counting squares } \\
\cline { 4 - 7 } & & & & \begin{tabular}{c} 
No. of full \\
squares
\end{tabular} & \begin{tabular}{c} 
No. of \\
incomplete \\
squares
\end{tabular} & \begin{tabular}{c} 
Total \\
squares (full)
\end{tabular} \\
\hline (i) & 5 units & 3 units & \(5 \times 3=15\) sq. units & 12 & 6 & 15 \\
\hline (ii) & & & & & & \\
\hline (iii) & & & & & & \\
\hline (iv) & & & & & & \\
\hline (v) & & & & & & \\
\hline (vi) & & & & & & \\
\hline (vii) & & & & & & \\
\hline
\end{tabular}
(ii) Do parallelograms with equal bases and equal heights have the same area?

\section*{Try This}
(i) Why is the formula for finding the area of a rectangle related to the formula for finding the area of a parallelogram?
(ii) Explain why a rectangle is a parallelogram but a parallelogram may not be a rectangle.

\section*{Exercise - 13.1}
1. Find the area of each of the following parallelograms.

(i)

(iii)
(ii)
2. PQRS is a parallelogram. PM is the height from P to SR and PN is the height from \(P\) to \(Q R\). If \(S R=12 \mathrm{~cm}\) and \(\mathrm{PM}=7.6 \mathrm{~cm}\).
(i) Find the area of the parallelogram PQRS
(ii) Find PN , if \(\mathrm{QR}=8 \mathrm{~cm}\).

3. \(D F\) and \(B E\) are the height on sides \(A B\) and \(A D\) respectively in parallelogram \(A B C D\). If the area of the parallelogram is \(1470 \mathrm{~cm}^{2}, \mathrm{AB}=35 \mathrm{~cm}\) and \(\mathrm{AD}=49 \mathrm{~cm}\), find the length of BE and DF.

4. The height of a parallelogram is one third of its base. If the area of the parallelogram is \(192 \mathrm{~cm}^{2}\), find its base and height.
5. In a parallelogram the base and height are in the ratio of 5:2. If the area of the parallelogram is \(360 \mathrm{~m}^{2}\), find its base and height.
6. A square and a parallelogram have the same area. If a side of the square is 40 m and the height of the parallelogram is 20 m , find the base of the parallelogram.

\subsection*{13.2 Area of triangle}

\subsection*{13.2.1 Triangles are parts of rectangles}

Draw a rectangle on a paper. Cut the rectangle along its diagonal to get two triangles.

Superimpose one triangle over the other. Are they exactly the same in area? Can we say that the triangles are congruent?

You will find that both the triangles are congruent. Thus, the area of the rectangle is equal to the sum of the area of the two triangles.

Therefore, the area of each triangle \(=\frac{1}{2} \times(\) area of rectangle \()\)
\[
=\frac{1}{2} \times(l \times b)=\frac{1}{2} l b
\]

\subsection*{13.2.2 Triangles are parts of parallelograms}

Make a parallelogram as shown in the Figure. Cut the parallelogram along its diagonal. You will get two triangles. Superimpose one triangle over the other. Are they exactly the same size (area)?

You will find that the area of the parallelogram is equal to the area of both the triangles.

We know that area of parallelogram is equal to product of its base and height. Therefore,

Area of each triangle \(=\frac{1}{2} \times(\) area of parallelogram \()\)

Area of triangle
\[
=\frac{1}{2} \times(\text { base } \times \text { height })
\]
\[
=\frac{1}{2} \times \mathrm{b} \times \mathrm{h}=\frac{1}{2} \mathrm{bh}
\]

Thus, the area of a triangle is equal to half the product of its base (b) and height (h) i.e., \(\mathrm{A}=\frac{1}{2} \mathbf{b h}\)

Example 2: Find the area of the triangle in the given figure.

\section*{Solution :}

Base of triangle (b) \(=13 \mathrm{~cm}\)
Height of triangle \((\mathrm{h})=6 \mathrm{~cm}\)
Area of a triangle \((\mathrm{A})=\frac{1}{2}(\) base \(\times\) height \()\) or \(\frac{1}{2} b h\)
Therefore, \(\quad A=\frac{1}{2} \times 13 \times 6\)
\[
=13 \times 3=39 \mathrm{~cm}^{2}
\]

Thus the area of the triangle is \(39 \mathrm{~cm}^{2}\).

Example 3: Find the area of \(\triangle \mathrm{ABC}\).
Solution: Base of the triangle (b) \(=8 \mathrm{~cm}\)
Height of the triangle \((\mathrm{h})=6 \mathrm{~cm}\)
Area of the triangle \((\mathrm{A})=\frac{1}{2} \mathrm{bh}\)
Therefore, \(\quad A=\frac{1}{2} \times 8 \times 6=24 \mathrm{~cm}^{2}\)
Thus, the area of \(\triangle \mathrm{ABC}=24 \mathrm{~cm}^{2}\)

cm
2. In \(\triangle P Q R, P Q=4 \mathrm{~cm}, \mathrm{PR}=8 \mathrm{~cm}\) and \(\mathrm{RT}=6 \mathrm{~cm}\). Find (i) the area of \(\triangle P Q R\) (ii) the length of QS.

3. \(\triangle \mathrm{ABC}\) is right-angled at A . AD is perpendicular to \(\mathrm{BC}, \mathrm{AB}=5 \mathrm{~cm}, \mathrm{BC}=13 \mathrm{~cm}\) and \(A C=12 \mathrm{~cm}\). Find the area of \(\triangle A B C\). Also, find the length of \(A D\).

4. \(\triangle \mathrm{PQR}\) is isosceles with \(\mathrm{PQ}=\mathrm{PR}=7.5 \mathrm{~cm}\) and \(\mathrm{QR}=9 \mathrm{~cm}\). The height PS from P to QR , is 6 cm . Find the area of \(\triangle P Q R\) and length of RT.

5. ABCD rectangle with \(\mathrm{AB}=8 \mathrm{~cm}, \mathrm{BC}=16 \mathrm{~cm}\) and \(\mathrm{AE}=4 \mathrm{~cm}\). Find the area of \(\triangle \mathrm{BCE}\). Is the area of \(\triangle \mathrm{BEC}\) equal to the sum of the area of \(\triangle \mathrm{BAE}\) and \(\triangle \mathrm{CDE}\) ? Why?

6. Ramu says that the area of \(\triangle \mathrm{PQR}\) is, \(\mathrm{A}=\frac{1}{2} \times 7 \times 5 \mathrm{~cm}^{2}\)

Gopi says that it is, \(\mathrm{A}=\frac{1}{2} \times 8 \times 5 \mathrm{~cm}^{2}\). Who is correct? Why?

7. Find the base of a triangle whose area is \(220 \mathrm{~cm}^{2}\) and height is 11 cm .
8. In a triangle the height is double the base and the area is \(400 \mathrm{~cm}^{2}\). Find the length of the base and height.
9. The area of triangle is equal to the area of a rectangle whose length and breadth are 20 cm and 15 cm respectively. Calculate the height of the triangle if its base measures 30 cm .
10. In Figure ABCD find the area of the shaded region \((\overline{\mathrm{DF}}=\overline{\mathrm{CF}})\).

11. In Figure ABCD , find the area of the shaded region.

12. Find the area of a parallelogram PQRS , if \(\mathrm{PR}=24 \mathrm{~cm}\) and \(\mathrm{QU}=\mathrm{ST}=8 \mathrm{~cm}\).

13. The base and height of the triangle are in the ratio \(3: 2\) and its area is \(108 \mathrm{~cm}^{2}\). Find its base and height.

\subsection*{13.3 Area of a rhombus}

Santosh and Akhila are good friends. They are fond of playing with paper cut-outs. One day, Santosh gave different triangle shapes to Akhila. From these she made different shapes of parallelograms. These parellelograms are given below-

Santosh asked Akhila, 'which parallelograms has 4 equal sides?"
Akhila said, 'the last two have equal sides."
Santhosh said, 'If all the sides of a parallelogram are equal, it is called a Rhombus.'
Now let us learn how to calculate the area of a Rhombus.
Like in the case of a parallelogram and triangle, we can use the method of splitting into congruent triangles to find the area of a rhombus.

ABCD is a rhombus.
Area of rhombus \(\mathrm{ABCD}=(\) area of \(\triangle \mathrm{ACD})+(\) area of \(\triangle \mathrm{ACB})\)
\[
\begin{aligned}
= & \left(\frac{1}{2} \times \mathrm{AC} \times \mathrm{OD}\right)+\left(\frac{1}{2} \times \mathrm{AC} \times \mathrm{OB}\right) \\
& \text { diagonals bisect perpendicularly } \\
= & \frac{1}{2} \mathrm{AC} \times(\mathrm{OD}+\mathrm{OB}) \\
= & \frac{1}{2} \mathrm{AC} \times \mathrm{BD} \\
= & \frac{1}{2} \mathrm{~d}_{1} \times \mathrm{d}_{2}\left(\text { as } \mathrm{AC}=\mathrm{d}_{1} \text { and } \mathrm{BD}=\mathrm{d}_{2}\right)
\end{aligned}
\]

In other words, the area of a rhombus is equal to half the product of its diagonals i.e., \(A=\frac{1}{2} \mathrm{~d}_{1} \mathrm{~d}_{2}\)

Example 4: Find the area of rhombus ABCD
Solution : Length of the diagonal \(\left(\mathrm{d}_{1}\right) \quad=7.5 \mathrm{~cm}\)
Length of the other diagonal \(\left(\mathrm{d}_{2}\right)=5.6 \mathrm{~cm}\)
Area of the rhombus (A) \(\quad=\frac{1}{2} d_{1} d_{2}\)

Therefore, \(\quad \mathrm{A}=\frac{1}{2} \times 7.5 \times 5.6=21 \mathrm{~cm}^{2}\)
Thus, area of rhombus \(\mathrm{ABCD}=21 \mathrm{~cm}^{2}\)
Example 5: The area of a rhombus is \(60 \mathrm{~cm}^{2}\) and one of its diagonals is 8 cm . Find the other diagonal.

Solution: Length of one diagonal ( \(\mathrm{d}_{1}\) ) \(=8 \mathrm{~cm}\)
Length of the other diagonal \(=\mathrm{d}_{2}\)
Area of rhombus \(\quad=\frac{1}{2} \times \mathrm{d}_{1} \times \mathrm{d}_{2}\)

Therefore,
\[
\begin{aligned}
60 & =\frac{1}{2} \times 8 \times \mathrm{d}_{2} \\
\mathrm{~d}_{2} & =15 \mathrm{~cm} .
\end{aligned}
\]

Thus, length of the other diagonal is 15 cm .

\section*{Exercise - 13.4}
1. Find the area of the following rhombuses.

2. Find the missing values.
\begin{tabular}{|c|c|c|}
\hline Diagonal-1 \(\left(\mathrm{d}_{1}\right)\) & Diagonal-2 \(\left(\mathrm{d}_{2}\right)\) & Area of rhombus \\
\hline 12 cm & 16 cm & \\
\hline 27 mm & & \(2025 \mathrm{~mm}^{2}\) \\
\hline 24 m & 57.6 m & \\
\hline
\end{tabular}
3. If length of diagonal of a rhombus whose area \(216 \mathrm{sq} . \mathrm{cm}\). is 24 cm . Then find the length of second diagonal.
4. The floor of a building consists of 3000 tiles which are rhombus shaped. The diagonals of each of the tiles are 45 cm and 30 cm . Find the total cost of polishing the floor tiles, if cost per \(\mathrm{m}^{2}\) is \({ }^{`} 2.50\).

\subsection*{13.4 Circumference of a circle}

Nazia is playing with a cycle tyre. She is rotating the tyre with a stick and running along with it.

What is the distance covered by tyre in one rotation?
The distance covered by the tyre in one rotation is equal to the length around the wheel. The length around the tyre is also called the circumference of the tyre.

What is the relation between the total distance covered by the tyre
 and number of rotations?

Total distance covered by the tyre \(=\) number of rotations \(\times\) length around the tyre.

\section*{Activity 2}

Jaya cut a circular shape from a cardboard. She wants to stick lace around the card to decorate it. Does the length of the lace required by her is equal to the circumference of the card? Can she measure the circumference of the card with the help of a ruler?

Let us see what Jaya did?
Jaya drew a line on the table and marked its starting point A. She then made a point on the edge of the card. She placed the circular card on the line, such that the point on the card coincided with point A. She then rolled the card along the line, till the point on the
 card touched the line again. She marked this point \(B\). The length of line \(A B\) is the circumference of the circular card. The length of the lace required around the circular card is the distance \(A B\).

\section*{Try This}

Take a bottle cap, a bangle or any other circular object and find its circumference using a string.

It is not easy to find the circumference of every circular shape using the above method. So we need another way for doing this. Let us see if there is any relationship between the diameter and the circumference of circles.

A man made six circles of different radii with cardboard and found their circumference using a string. He also found the ratio between the circumference and diameter of each circle.

He recorded his observations in the following table-
\begin{tabular}{|l|c|c|c|c|}
\hline Circle & Radius & Diameter & Circumference & Ratio of circumference and diameter \\
\hline 1. & 3.5 cm & 7.0 cm & 22.0 cm & \(\frac{22}{7}=3.14\) \\
\hline 2. & 7.0 cm & 14.0 cm & 44.0 cm & \(\frac{44}{14}=3.14\) \\
\hline 3. & 10.5 cm & 21.0 cm & 66.0 cm & \\
\hline 4. & 21.0 cm & 42.0 cm & 132.0 cm & \\
\hline 5. & 5.0 cm & 10.0 cm & 32.0 cm & \\
\hline 6. & 15.0 cm & 30.0 cm & 94.0 cm & \\
\hline
\end{tabular}

What can you infer from the above table? Is the ratio between the circumference and the diameter of each circle approximately the same? Can we say that the circumference of a circle is always about three times its diameter?

The approximate value of the ratio of the circumference to the diameter of a circle is \(\frac{22}{7}\) or 3.14. Thus it is a constant and is denoted by \(\pi\) (pi).

Therefore, \(\frac{c}{d}=\pi\) where 'c' is the circumference of the circle and 'd' its diameter.

Since,
\[
\begin{aligned}
\frac{c}{d} & =\pi \\
c & =\pi \mathrm{d}
\end{aligned}
\]

Since, diameter of a circle is twice the radius i.e. \(d=2 r(r=\) radius \()\)
\[
\mathrm{c}=\pi \times 2 \mathrm{r} \quad \text { or } \quad \mathrm{c}=2 \pi \mathrm{r}
\]

Thus, circumference of a circle, \(c=\pi d\) or \(2 \pi r\)

Example 6: Find the circumference of a circle with diameter 10 cm . (Take \(\pi=3.14\) )
Solution : Diameter of the circle (d) \(=10 \mathrm{~cm}\).
Circumference of circle (c) \(=\pi \mathrm{d}\)
\[
=3.14 \times 10
\]
\[
\mathrm{c}=31.4 \mathrm{~cm}
\]

Thus, the circumference of the circle is 31.4 cm .
Example 7: Find the circumference of a circle with radius 14 cm . (Take \(\pi=\frac{22}{7}\) )
Solution: Radius of the circle (r) \(\quad=14 \mathrm{~cm}\)
Circumference of acircle (c) \(=2 \pi \mathrm{r}\)
\[
\text { Therefore, } \begin{aligned}
\text { c } & =2 \times \frac{22}{7} \times 14 \\
\text { c } & =88 \mathrm{~cm}
\end{aligned}
\]

Thus, the circumference of the circle is 88 cm .

\section*{Exercise - 13.5}
1. Find the circumference of a circle whose radius is-
(i) 35 cm
(ii) 4.2 cm
(iii) 15.4 cm
2. Find the circumference of circle whose diameter is-
(i) 17.5 cm
(ii) 5.6 cm
(iii) 4.9 cm

Note : take \(\pi=\frac{22}{7}\) in the above two questions.
3. (i) Taking \(\pi=3.14\), find the circumference of a circle whose radius is
(a) 8 cm
(b) 15 cm
(c) 20 cm
(ii) Calculate the radius of a circle whose circumference is 44 cm ?
4. If the circumference of a circle is 264 cm , find its radius. Take \(\pi=\frac{22}{7}\).
5. If the circumference of a circle is 33 cm , find its diameter.
6. How many times will a wheel of radius 35 cm be rotated to travel 660 cm ?
( Take \(\pi=\frac{22}{7}\) ).
7. The ratio of the diameters of two circles is \(3: 4\). Find the ratio of their circumferences.
8. A road roller makes 200 rotations in covering 2200 m . Find the radius of the roller.
9. The minute hand of a circular clock is 15 cm . How far does the tip of the minute hand move in 1 hour?
(Take \(\pi=3.14\) )

10.

A wire is bent in the form of a circle with radius 25 cm . It is straightened and made into a square. What is the length of the side of the square?

\subsection*{13.5 Rectangular Paths}

We often come across such walking paths in garden, park and playground areas. Now we shall learn how to measure the areas of such paths as this often useful in calculating their costs of construction.

Example 8: A plot is 60 m long and 40 m wide. A path 3 m wide is to be constructed around the plot. Find the area of the path.

Solution : Let ABCD be the given plot. A 3 m wide path is running all around \(i t\). To find the area of this path we have to subtract the area of the smaller rectangle ABCD from the area of the bigger rectangle EFGH.

Length of inner rectangle \(\mathrm{ABCD}=60 \mathrm{~m}\)
Breadth of inner rectangle \(\mathrm{ABCD}=40 \mathrm{~m}\)
Area of inner rectangle \(\mathrm{ABCD}=(60 \times 40) \mathrm{m}^{2}\)
\begin{tabular}{rl} 
& \(=2400 \mathrm{~m}^{2}\) \\
& \(=3 \mathrm{~m}\) \\
Width of the path & \(=60 \mathrm{~m}+(3+3) \mathrm{m}\) \\
Length of outer rectangle EFGH & \(=66 \mathrm{~m}\) \\
& \(=40 \mathrm{~m}+(3+3) \mathrm{m}\) \\
Breadth of outer rectangle EFGH & \(=46 \mathrm{~m}\)
\end{tabular}
\[
\begin{aligned}
\text { Area of the outer rectangle EFGH } & =66 \times 46 \mathrm{~m}^{2} \\
& =3036 \mathrm{~m}^{2}
\end{aligned}
\]

Area of the path \(=\) Area of the outer rectangle \(\mathrm{EFGH}-\) Area of the inner rectangle ABCD Therefore, area of the path \(=(3036-2400) \mathrm{m}^{2}\)
\[
=636 \mathrm{~m}^{2}
\]

Example 9: The dimensions of a rectangular field are 90 m and 60 m . Two roads PQRS and EFGH are constructed such that they cut each other at the centre of the field and are parallel to its sides as shown in the figure. If the width of each road is 3 m , find-
(i) The area covered by the roads.
(ii) The cost of constructing the roads at the rate of \(₹ 110\) per \(\mathrm{m}^{2}\).

Solution : Let ABCD be the rectangular field. PQRS and EFGH are the 3 m roads.
From the question we know that,
\[
\begin{array}{ll}
\mathrm{PQ}=3 \mathrm{~m}, \text { and } & \mathrm{PS}=60 \mathrm{~m} \\
\mathrm{EH}=3 \mathrm{~m}, \text { and } & \mathrm{EF}=90 \mathrm{~m} \\
\mathrm{KL}=3 \mathrm{~m} & \mathrm{KN}=3 \mathrm{~m}
\end{array}
\]

Here, KLMN is a square.
(i) Area of the crossroads is the area of the rectangle PQRS and the area of the rectangle EFGH . As is clear from the picture, the area of the square KLMN will be taken twice in this calculation thus needs to be subtracted once.

Area of the roads \(=\) Area of the rectangle \(\mathrm{PQRS}+\) Area of the rectangle EFGH - Area of the square KLMN
\[
\begin{aligned}
& =(\mathrm{PS} \times \mathrm{PQ})+(\mathrm{EF} \times \mathrm{EH})-(\mathrm{KL} \times \mathrm{KN}) \\
& =(60 \times 3)+(90 \times 3)-(3 \times 3) \\
& =(180+270-9) \\
& =441 \mathrm{~m}^{2}
\end{aligned}
\]
(ii) Cost of construction \(=₹ 110\) per \(\mathrm{m}^{2}\)

Cost of constructing \(441 \mathrm{~m}^{2}=110 \times 441\)
Cost of constructing the roads \(=₹ 48,510\)
Example 10 : A path of 5 m wide runs around a square park of side 100m. Find the area of the path. Also find the cost of cementing it at the rate of ₹ 250 per \(10 \mathrm{~m}^{2}\)

Solution: In the figure PQRS is a square park. The shaded region represents the 5 m wide path.
Length of side of square PQRS \(\quad=100 \mathrm{~m}\)
Area of the square PQRS
\[
=(\text { side })^{2}=(100 \mathrm{~m})^{2}=10000 \mathrm{~m}^{2}
\]

Length of side of square \(A B C D\)
\(=100+(5+5)=110 \mathrm{~m}\)
Area of the square \(\mathrm{ABCD}=(\text { side })^{2}=(110 \mathrm{~m})^{2}=12100 \mathrm{~m}^{2}\)
\(\therefore\) Area of the path \(=\) Area of square \(\mathrm{ABCD}-\) Area of square PQRS
\[
=(12100-10000)=2100 \mathrm{~m}^{2}
\]

Cost of the cementing per \(10 \mathrm{~m}^{2}=₹ 250\)
Therefore, cost of the cementing \(1 \mathrm{~m}^{2}=\frac{250}{10}\)
Thus, cost of cementing \(2100 \mathrm{~m}^{2}=\frac{250}{10} \times 2100=₹ 52,500\)
Therefore, cost of cementing is ₹ \(₹ 2,500\).

Exercise - 13.6
1. A path 2.5 m wide is running around a square field whose side is 45 m . Determine the area of the path.
2. The central hall of a school is 18 m long and 12.5 m wide. A carpet is to be laid on the floor leaving a strip 50 cm wide near the walls, uncovered. Find the area of the carpet and also the uncovered portion?
3. The length of the side of a grassy square plot is 80 m . Two walking paths each 4 m wide are constructed parallel to the sides of the plot such that they cut each other at the centre of the plot. Determine the area of the paths.
4. A verandah 2 m wide is constructed all around a room of dimensions \(8 \mathrm{~m} \times 5 \mathrm{~m}\). Find the area of the verandah
5. The length of a rectangular park is 700 m and its breadth is 300 m . Two crossroads, each of width 10 m , cut the centre of a rectangular park and are parallel to its sides. Find the area of the roads. Also, find the area of the park excluding the area of the crossroads.

\section*{Looking Back}
- The area of the parallelogram (A) is equal to the product of its base (b) and corresponding height (h) i.e., \(A=b h\) (Any side of the parallelogram can be taken as the base).

- The area of a triangle (A) is equal to half the product of its base (b) and height (h) i.e., \(\mathrm{A}=\frac{1}{2} \mathrm{bh}\).
- The area of a rhombus \((A)\) is equal to half the product of its diagonals i.e., \(\mathbf{A}=\frac{1}{2} \mathrm{~d}_{1} \mathrm{~d}_{2}\).
- The circumference of a circle \((\mathrm{C})=2 \pi \mathrm{r}\) where r is the radius of the circle and \(\pi=\frac{22}{7}\) or 3.14 .

Arcfimedes (Greece) 287-212 BC
\(\mathcal{H e}\) calculated the value of \(\pi\) first time. He also evolved the mathematicalformulae for finding out the circumference and area of a circle.

\section*{Chapter}

14

\subsection*{14.0 Introduction}

We have been introduced to various three-dimensional shapes in class VI. We have also identified their faces, edges and vertices. Let us first review what we have learnt in class VI.

\section*{Exercise - 14.1}
1. Given below are the pictures of some objects. Categorise and fill write their names according to their shape and fill the table with name of it.

\begin{tabular}{|l|l|l|l|c|c|c|}
\hline & & & Cuboid & Cone & Cube \\
\hline & & & & & \\
\hline & & & & & \\
\hline & & & & & \\
\hline & & & & \\
\hline
\end{tabular}
2. Write names of at least 2 objects from day-to-day life, which are in the shape of the basic 3D shapes given below:
(i) Cone
(ii) Cube
(iii) Cuboid
(iv) Sphere

\(\qquad\)
\(\qquad\)
(v) Cylinder \(\qquad\)
```

-----------

```
 ----------------------- \(\qquad\)
\(\qquad\)
\(\qquad\)
\(\qquad\)
\(\qquad\)
\(\qquad\)
\(\qquad\)

3. Identify and state the number of faces, edges and vertices of the figures given below:
\begin{tabular}{|c|c|c|c|}
\hline &  & Cuboid &  \\
\hline Faces & & - & \\
\hline Edges & & \(\cdots\) & \\
\hline Vertices & &  & \\
\hline
\end{tabular}

\subsection*{14.1 Nets of 3-D shapes}

We now visualise 3-D shapes on 2-D surfaces, that is on a plain paper. This can be done by drawing the 'nets' of the various 3-D figures.

Take a cardboard box (cartoon of tooth paste or shoes etc.,). Cut the edges to lay the box flat. You have now a net for that box. Anet is a sort of skeleton-outline in 2-D (Figure 1), which, when folded (Figure 2), results in a 3-D shape (Figure 3).

Figure 1

Figure 2

Figure 3

Here is a net pattern for a box. Trace it and paste it on a thick paper and try to make the box by suitably folding and gluing together. What is the shape of the box?

Figure 1

Figure 2

Similarly, take a cover of an ice-cream cone or any like shape. Cut it along it's slant surface as shown in Figure 1. You will get the net for the cone as shown in Figure 2.
 .

\section*{Try This}

Take objects having different shapes (cylinder, cube, cuboid and cone) and cut them to get their nets with help of your teachers or friends.

You will come to know by the above activity that you have different nets for different shapes. Also, each shape can also have more than one net according to the way we cut it.

\section*{Exercise - 14.2}
1. Some nets are given below. Trace them and paste them on a thick paper. Try to make 3-D shapes by suitably folding them and gluing together. Match the net with it's 3-D shape.

3D shapes

2. Three nets for each shape are given here. Match the net with its 3D-shape.
(i)

(a)
(ii)

(b)
3. A dice is a cube with dots on each face. The opposite faces of a dice always have a total of seven dots on them.

Here are two nets to make dice. Insert the suitable number of dots in blanks.

\section*{Play This}

You and your friend sit back to back. One of you read out a net to make a 3-D shape, while the other copies it and sketches or builds the described object.

\subsection*{14.2 Drawing solids on a flat surface}

Our drawing surface is a paper, which is a flat surface. When you draw a solid shape, the images are somewhat distorted. It is a visual illusion. You will find here two techniques to help you to draw the 3-D shapes on a plane surface.

\subsection*{14.2.1 Oblique Sketches}

Here is a picture of a cube. It gives a clear idea of how the cube looks, when seen from the front. You do not see all the faces as we see in reality. In the picture, all the lengths are not equal, as they are in a real cube. Still, you are able to recognise it as a cube. Such a sketch of a solid is called an oblique sketch.

How can you draw such sketches? Let us attempt to learn the technique. You need a squared (lines or dots) paper. Initially practice to draw on these sheets and later on a plain sheet (without the aid of squared lines or dots!) Let us attempt to draw an oblique sketch of a \(3 \times 3 \times 3\) cube (each edge is 3 units).

Step 1
Draw the front face.

Step 3
Join the corresponding corners

Step 2
Draw the opposite face. Sizes of the faces have to be same, but the sketch is somewhat off-set from step 1.

Step 4
Redraw using doted lines for hidden edges. (It is a convention) The sketch is ready now.

In the above oblique sketch did you notice the following?
(i) The sizes of the front face and its opposite face are same.
(ii) The edges, which are all equal in a cube, appear so in the sketch, though the actual measures of edges are not taken so.
You could now try to make an oblique sketch of a cuboid (remember the faces in this case are rectangles).

You can draw sketches in which measurements also agree with those of a given solid. To do this we need what is known as an isometric sheet. Let us try to make a cuboid with dimensions 7 cm length, 3 cm breadth and 4 cm height on an isometric sheet.

\subsection*{14.2.2 Isometric Sketches}

To draw sketches in which measurements also agree with those of the given solid, we can use isometric dot sheets. In such a sheet the paper is divided into small equilateral triangles made up of dots or lines. Let us attempt to draw an isometric sketch of a cuboid of dimensions \(7 \times 3 \times 4\) (which means the edges forming length, breadth and height are 7,3,4 units respectively).

Step 1
Draw a rectangle to show the front face

Connect the matching corners
with appropriate line segments.

Step 2
Draw four parallel line segments of length 3 units starting from the four corners of the rectangle.

Note that the measurements of the solid are of exact size in an isometric sketch; this is not so in the case of an oblique sketch.

Example 1: Here is an oblique sketch of a cuboid. Draw an isometric sketch that matches this drawing.

Solution : The length, breadth and height are 3, 3 and 6 units respectively

Exercise - 14.3
1. Use an isometric dot paper and make an isometric sketch for each one of the given shapes.
(i)

(ii)

(iii)

2. The dimensions of a cuboid are \(5 \mathrm{~cm}, 3 \mathrm{~cm}\) and 2 cm . Draw three different isometric sketches of this cuboid.
3. Three cubes each with 2 cm edge are placed side by side to form a cuboid. Draw an oblique or isometric sketch of this cuboid.
4. Make an oblique sketch for each of the given isometric shapes.
(i)

(iii)

(iv)

5. Give (i) an oblique sketch and (ii) an isometric sketch for each of the following:
(a) A cuboid of dimensions \(5 \mathrm{~cm}, 3 \mathrm{~cm}\) and 2 cm . (Is your sketch unique?)
(b) A cube with an edge 4 cm long.

\subsection*{14.3 Visualising solid objects}

Sometimes when you look at combined shapes, some of them may be hidden from your view.

Here are some activities to help you visualise some solid objects and how they look. Take some cubes and arrange them as shown below.

Now ask your friend to see from the front and guess the total number of cubes in the following arrangements.

\section*{Try This}

Estimate the number of cubes in the following arrangements.

Such visualisations are very helpful.
Suppose you form a cuboid by joining cubes. You will be able to estimate what the length, breadth and height of the cuboid would be.

Example 2: If two cubes of dimensions \(2 \mathrm{~cm} \times 2 \mathrm{~cm} \times 2 \mathrm{~cm}\) are placed side by side, what would the dimensions of the resulting cuboid be?

Solution : As you can see when kept side by side, the length is the only measurement which increases.

Length \(=2+2=4 \mathrm{~cm}\).

Breadth \(=2 \mathrm{~cm}\) and Height \(=2 \mathrm{~cm}\).

\section*{Try This}
1. Two dice are placed side by side as shown. Can you say what the total would be on the faces opposite to them? (i) \(5+6\) (ii) \(4+3\)
(Remember that in a dice the sum of numbers on opposite faces is 7)
2. Three cubes each with 2 cm edge are placed side by side to form a cuboid. Try to make an oblique sketch and say what could be its length, breadth and height.

\subsection*{14.3.1 Viewing different sections of a solid}

Now let us see how an object which is in 3-D can be viewed in different ways.

\subsection*{14.3.1a) One way to view an object is by cutting or slicing the object}

\section*{Slicing game}

Here is a loaf of bread. It is like a cuboid with square faces. You 'slice' it with a knife.

When you give a 'horizontal' cut, you get several pieces,
 as shown in the figure. Each face of the piece is a square! We call this face a 'cross-section' of the whole bread. The cross section is nearly a square in this case.

Beware! If your cut is 'vertical' you may get a different cross section! Think about it. The boundary of the cross-section you obtain is a plane curve. Do you notice it?

\section*{A kitchen play}

Have you noticed cross-sections of some vegetables when they are cut for the purposes of cooking in the kitchen? Observe the various slices and get aware of the shapes that results as cross-sections.

\section*{Do This}
1. Make clay (or plasticine) models of the following solids and make vertical or horizontal cuts. Draw rough sketches of the cross-sections you obtain. Name them if possible.

2. What cross-sections do you get when you give a (i) vertical cut (ii) horizontal cut to the following solids?
(a) A brick (b) A round apple (c) A die (d) A cylindrical pipe (e) An ice cream cone

\subsection*{14.3.1b) Another Way is by Shadow Play}

\section*{A shadow play}

Shadows are a good way to illustrate how three-dimensional objects can be viewed in two dimensions. Have you seen a shadow play? It is a form of entertainment using solid articulated figures in front of an illuminated backdrop to create the illusion of moving images. It makes some indirect use of
 ideas of Mathematics.

You will need a source of light and a few solid shapes for this activity. If you have an overhead projector, place the solid under the lamp and do these investigations.

Keep a torchlight, right in front of a cone. What type of shadow does it cast on the screen? (Figure 1).
The solid is three-dimensional; what about the shadow?
If, instead of a cone, you place a cube in the above game, what type of shadow will you get?
Experiment with different positions of the source of light and with different positions of the solid object. Study their effects on the shapes and sizes of the shadows you get.

Here is another funny experiment that you might have tried already:
Place a circular tumbler in the open when the sun at the noon time is just right above it as shown in the figure below. What is the shadow that you obtain?

Will it be same during (a) afternoon?

(b) evening?

Study the shadows in relation to the position of the sun and the time of observation.

\section*{Exercise－ 14.4}

1．A bulb is kept burning just right above the following solids．Name the shape of the shadows obtained in each case．Attempt to give a rough sketch of the shadow．（You may try to experiment first and then answer these questions）．

A ball

A cylindrical pipe

A book

2．Here are the shadows of some 3D objects，when seen under the lamp of an overhead projector．Identify the solid（s）that match each shadow．（There may be many answers for these！）

A circle

（i）

A square

（ii）

A triangle

（iii）

A rectangle

（iv）

\section*{Looking Back}

3D shapes can be visualised on 2D surfaces，that is on paper by drawing their nets．

Oblique sketches and isometric sketches help in visualising 3D
shapes on a plane surface．

\section*{Fun with a cube}

A unit cube can fitted together with 7 other identical cubes to make a larger cube with an edge of 2 units as shown in figure．

How many unit cubes are needed to make a cube with an edge of 3 units？

\subsection*{15.0 Introduction}

Look around you. You will find that many objects around you are symmetrical. So are the objects that are drawn below.

All these objects are symmetrical as they can be divided in such a way that their two parts coincide with each other.

\subsection*{15.1 Line Symmetry}

Let us take some more examples and understand what we mean. Trace the following figures on a tracing paper.

Figure 1

Figure 2

Figure 3

Figure 4

Fold Figure 1 along the dotted line. What do you observe?
You will find that the two parts coincide with each other. Is this true in Figure 2 and 3?
You will observe that in Figure 2, this is true along two lines and in Figure 3 along many lines. Can Figure 4 be divided in the same manner?

Figure 1, 2 and 3 have line symmetry as they can be divided in such a manner that two parts of the figure coincide with each other when they are folded along the line of symmetry. The dotted line which divides the figures into two equal parts is the line of symmetry or axis of symmetry. As you have seen, an object can have one or more than one lines of symmetry or axes of symmetry.

\section*{ \\ Try This}
1. Name a few things in nature, that are symmetric.
2. Name 5 man-made things that are symmetric.

\section*{Exercise - 15.1}
1. Given below are some fiugres. Which of them are symmetric? Draw the axes of symmetry for the symmetric figures.

(i)

(ii)

(iii)

(iv)

(v)

(ix)

(xii)

(x)

(xiii)

(xi)

(xiv)

(xv)

(xviii)

(xvi)

(xvii)

(xix)

(xx)

(xxi)

(xxii)

(xxiii)

\subsection*{15.1.1 Lines of symmetry for regular polygons}

Look at the following closed figures,

A closed figure made from several line segments is called a 'Polygon'. Which of the above figures are polygons?
\begin{tabular}{l} 
1. Can we make a polygon with less than three line segments? \\
2. What is the minimum number of sides of a polygon? \\
\hline
\end{tabular}

Observe the different triangles below.

Figure 1

Figure 2

Figure 3

In Figure 3, the triangle has equal sides and congruent angles. It is thus called a regular polygon.
A polygon, with all sides and all angles equal is called a 'Regular Polygon'.
Which of the following polygons are regular polygons?

Parallelogram

Square

Trapezium

Equilateral triangle

Rectangle

Now draw axes of symmetry for the following regular polygons.

Equilateral Triangle

Square

Regular Pentagon

Regular Hexagon

Write down your conclusions in the table below.
\begin{tabular}{|l|c|c|}
\hline Regular Polygon & No. of sides & No. of axes of symmetry \\
\hline EquilateralTraingle & 3 & 3 \\
\hline Square & & \\
\hline Pentagon & & \\
\hline Hexagon & & \\
\hline
\end{tabular}

Did you find any relationship between the number of sides of a regular polygon and number of axes of symmetry? You will find that the number of sides is equal to number of axes of symmetry.

You can verify above result by tracing out all the four figures on a paper, cutting them out and actually folding each figure. Try this.

\section*{Try This}
1. Given below are different types of triangles. Do all the triangles have the same number of lines of symmetry? Which triangle has more?

2. Given below are different types of quadrilaterals. Do all of them have the same number of lines of symmetry? Which quadrilateral has the most?

Hint: You can trace the triangles and quadrilaterals on a tracing paper and actually fold each figure to find the axes of symmetry.
3. On the basis of above two cases, can we say that a regular polygon has the maximum number of axes of symmetry.

\section*{Exercise - 15.2}
1. In the figures given below find the axes of symmetry such that on folding along the axis the two dots fall on each other.

(i)

(ii)

(iii)

(iv)

(vii)

(v)

(viii)

(vi)

(ix)
2. Given the axes of symmetry for below figures. But only one part has a dot. Find the other dot.

(i)

(ii)

(iii)

(iv)
3. In the following incomplete figures, the mirror line (i.e the line of symmetry) is given as a dotted line. Complete each figure, performing reflection on the dotted (mirror) line and draw in your notebook (You might perhaps place a mirror along the dotted line and look into the mirror for the image). Can you recall the name of the figure you complete?

(i)

(ii)

(iii)

(iv)

(v)

(vi)
4. State whether the following statements are true or false.
(i) Every closed figure has an axis of symmetry.
(ii) A figure with at least one axis of symmetry is called a symmetric figure.
(iii) A regular polygon of 10 sides will have 12 axes of symmetry.
5. Construct a square and draw all its axes of symmetry. Measure the angles between each pair of successive axes of symmetry. What do you notice? Does the same rule apply for other regular polygons?

\subsection*{15.2 Rotational Symmetry}

Activity 1 Trace the following diagram onto a tracing paper.

Try to fold the diagram so that its two parts coincide. Is this diagram symmetric?
Now, let us try to match the different positions of the diagram in another way. Draw the above diagram on a piece of paper. Mark a point 'O'at the centre and name the four edges of the paper A,B,C,D as shown in Figure 1.

Figure 1
Rotate the paper around the marked point 'O' for \(180^{\circ}\).

Figure 2
What do you notice in Figure 2? Does this diagramlook different from the previous one?
Due to the rotation, the points \(\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}\) have changed position however the diagram seems to be unchanged. This is because the diagram has rotational symmetry.

\section*{Activity 2 Lets make a wind wheel}
- Take a square shaped paper.
- Fold it along the diagonals.
- Starting from one corner, cut the paper along the diagonals towards the centre, up to one fourth of the length of the diagonal. Do the same from the remaining corners.
- Fold the alternate corners towards the centre as shown in the figure.
- Stick the folded corners if required and fix the mid point to a stick with a pin so that the paper rotates freely.
- Face it in the opposite direction of the wind. You will find it rotates

Now, let us rotate the wind-wheel by \(90^{\circ}\). After each rotation of \(90^{\circ}\) you will see that the windwheel looks exactly the same. The wind-wheel has rotational symmetry.

Thus, if we rotate a figure, about a fixed point by a certain angle and the figure looks exactly the same as before, we say that the figure has rotational symmetry.

\subsection*{15.2.1 Angle of Rotational Symmetry}

We know that the square has line symmetry and 4 axes of symmetry. Now, let us see if the square has rotational symmetry.

Consider a square as in Figure (i) with P as one of its corners with two axes of symmetry.

Figure 1

Figure 2

Figure 3

Figure 4

Figure 5

Let Figure 1 represent the initial position of square.
Rotate the square by 90 degrees about the centre. This quarter turn will lead to Figure 2. Note the position of P. In this way, rotate the square again through 90 degrees and you get Figure 3. When we complete four quarter turns, the square reaches its original position as in Figure 5. If we observe after each turn of \(90^{\circ}\), the square looks exactly like it did in its original position. Hence, the square has rotational symmetry.

In the above activity all the positions in figure 2, figure 3, figure 4 and figure 5 obtained by the rotation of the first figure through \(90^{\circ}, 180^{\circ}, 270^{\circ}\) and \(360^{\circ}\) look exactly like the original figure 1 . Minimum of these i.e., \(90^{\circ}\) is called the angle of rotational symmetry.

The minimum angle rotation of a figure to get exactly the same figure as original is called the "angle of rotational symmetry" or "angle of rotation".

\section*{Do This}
1. What is the angle of rotational symmetry of a square?
2. What is the angle of rotational symmetry of a parallelogram?
3. What is the angle of rotational symmetry of a circle?

\subsection*{15.2.2 Order of rotational symmetry}

In the above activity, the angle of rotational symmetry of square is \(90^{\circ}\) and the figure is turned through the angle of rotational symmetry for 4 times before it comes to original position. Now we say that the square has rotational symmetry of order 4.

Consider an equilateral triangle. Its angle of rotational symmetry is \(120^{\circ}\). That means it has to be rotated \(120^{\circ}\) about its centre for 3 times to get exactly the same position as the original one. So the order of rotational symmetry of a equilateral triangle is 3 .

By these examples we conclude that the number of times a figure, rotated through its angle of rotational symmetry before it comes to original postion is called order of rotational symmetry.

Let us conclude from the above examples
- The centre of rotational symmetry of a square is its intersection point of its diagonals.
- The angle of rotational symmetry for a square is \(90^{\circ}\).
- The order of rotational symmetry for a sqaure is 4 .

(ii) How many lines of symmetry are there in each figure?
(iii) What is the angle between every adjacent axes?
2. Look around you. Name 5 objects having rotational symmetry.

Note: It is important to understand that all figures have rotational symmetry of order 1, as can be rotated completely through \(360^{\circ}\) to come back to its original position. So we say that an object has rotational symmetry, only when the order of symmetry is more than 1.

\section*{Exercise - 13.1}
1. Which of the following figures have rotational symmetry of order more than 1 ?

(i)

(ii)

(iv)

(v)
2. Give the order of rotational symmetry for each figure.

(i)

(ii)

(iii)

(vii)
(iv)

(v)

(vi)

(viii)
3. Draw each of the shapes given below and fill in the blanks.
\begin{tabular}{|l|l|l|l|}
\hline \multicolumn{1}{|c|}{ Shape } & \begin{tabular}{c}

\end{tabular} & Angle of Rotation & \begin{tabular}{c} 
Order of Rota \\
-tion
\end{tabular} \\
\hline Square & & & \\
\hline Rectangle & & & \\
\hline Rhombus & & & \\
\hline EquilateralTriangle & & & \\
\hline Regular Hexagon & & & \\
\hline Circle & & & \\
\hline Semi-circle & & & \\
\hline
\end{tabular}

\subsection*{15.3 Line symmetry and rotational symmetry}

By now you must have realised that some shapes only have line symmetry and some have only rotational symmetry (of order more than 1) and some have both. Squares and equilateral triangles have both line and rotational symmetry. The circle is the most perfect symmetrical figure, because it can be rotated about its centre through any angle and it will look the same. A circle also has unlimited lines of symmetry.

Example 1: Which of the following shapes have line symmetry? Which have rotational symmetry?

(i)

(ii)

(iii)

(iv)
\begin{tabular}{|c|c|c|}
\hline Figure & Line symmetry & Rotational symmetry \\
\hline 1. & Yes & No \\
\hline 2. & No & Yes \\
\hline 3. & Yes & Yes \\
\hline 4. & No & Yes \\
\hline
\end{tabular}

\section*{Activity 3}
- Take a square shaped paper.
- Fold it in the middle vertically first, then horizontally.
- Then fold along a diagnal such that the paper takes a triangular shape (Figure 4).
- Cut the folded edges as shown in the figure or as you wish (Figure 5).
- Now open the piece of paper.

Figure 1

Figure 2

Figure 3

Figure 4

Figure 5

(i) Does this paper (after design cut) has line symmetry? If it has then how many lines of symmetry?
(ii) Does this paper has rotational symmetry?

\section*{Exercise - 15.4}
1. Some english alphabets have fascinating symmetrical structures. Which capital letters have only one line of symmetry (like E)? Which capital letters have rotational symmetry of order 2 (like I)?

Examine and fill the following table, thinking along such lines.
\begin{tabular}{|c|c|c|c|c|}
\hline Alphabets & \begin{tabular}{c} 
Line \\
symmetry
\end{tabular} & \begin{tabular}{c} 
Number oflines \\
symmetry
\end{tabular} & \begin{tabular}{c} 
Rotational \\
symmetry
\end{tabular} & \begin{tabular}{c} 
Order of \\
rotational \\
symmetry
\end{tabular} \\
\hline Z & No & 0 & Yes & 2 \\
\hline S & & & & \\
\hline H & & & & \\
\hline O & & 1 & No & - \\
\hline E & Yes & & & \\
\hline N & & & & \\
\hline C & & & & \\
\hline
\end{tabular}

Collect pictures of symmetrical figures from newspapers, magazines and advertisement pamphlets. Draw the axes of symmetry over them. Classify them.

\section*{Looking Back}
- The line which divides a figure into two identical parts is called the line of symmetry or axis of symmetry.

- An object can have one or more than one lines of symmetry or axes of symmetry.
- If we rotate a figure, about a fixed point by a certain angle and the figure looks exactly the same as before, we say that the figure has rotational symmetry.
- The minimum angle rotation of a figure to get exactly the same figure as original is called the "angle of rotational symmetry" or "angle of rotation".
- All figures have rotational symmetry of order 1 , as can be rotated completely through \(360^{\circ}\) to come back to their original position. So we say that an object has rotational symmetry only when the order of symmetry is more than 1 .
- Some shapes only have line symmetry and some have only rotational symmetry and some have both. Squares, equilateral triangles and circles have both line and rotational symmetry.

\section*{04 - Lines and Angles}

\section*{Exercise - 4.1}
(1)
(i) Line segment AB
(ii) Ray CD
(iii) Line XY
(iv) Point ' P '
(2)
(i) \(\mathrm{O} \quad \mathrm{P}\)
(ii) X
(iii) R S
(iv) C

D
(3) \(\overline{\mathrm{AB}}, \overline{\mathrm{AC}}, \overline{\mathrm{AD}}, \overline{\mathrm{BC}}, \overline{\mathrm{BD}}, \overline{\mathrm{CD}}\)
(i) acute
(ii) obtuse
(iii) Right
(iv) acute
(v) obtuse
(6) \(\angle \mathrm{FOA}, \angle \mathrm{EOF}, \angle \mathrm{DOE}, \angle \mathrm{COD}, \angle \mathrm{BOC}, \angle \mathrm{DOF}, \angle \mathrm{EOF}, \angle \mathrm{BOD}\) - Acute angles. \(\angle \mathrm{AOE}, \angle \mathrm{BOE}, \angle \mathrm{COF}\) - Right angles ; \(\angle \mathrm{DOA}, \angle \mathrm{COA}, \angle \mathrm{BOF}\) - Obtuse angles. \(\angle\) BOA - Straight angle (7) (i) and (iv) are parallel ; (ii) and (iii) non parallel
(8) (i),(ii) and (iv) are intersecting lines and (iii) non-intersecting lines.

\section*{Exercise - 4.2}
(1) iii
(2) (i) \(65^{\circ}\)
(ii) \(50^{\circ}\)
(iii) \(1^{\circ}\)
(iv) \(35^{\circ}\)
(3) \(45^{\circ}, 45^{\circ}\)
(4) Yes. Because the sum of the angles must be \(90^{\circ}\)

\section*{Exercise - 4.3}
(1) (i), (ii)
(2) (i) \(75^{\circ}\)
(ii) \(85^{\circ}\)
(iii) \(30^{\circ}\)
(iv) \(160^{\circ}\)
(3) The sum of two acute angles is always less than \(180^{\circ}\)
(4) \(90^{\circ}, 90^{\circ}\)

\section*{Exercise - 4.4}
(1)
(i) \(\mathrm{a}, \mathrm{b} \quad\) (ii) \(\mathrm{c}, \mathrm{d}\)
(2) (i) \(\angle \mathrm{AOD}, \angle \mathrm{DOB}\)
(ii) \(\angle \mathrm{DOB}, \angle \mathrm{BOC}\)
(iii) \(\angle \mathrm{BOC}, \angle \mathrm{COA}\) (iv) \(\angle \mathrm{COA}, \angle \mathrm{AOD}\)
(3)
Yes.
 because \(\angle \mathrm{AOC}+\angle \mathrm{BOC}=180^{\circ}\)
(4) Yes.
 because \(\angle \mathrm{BOA}+\angle \mathrm{COB}=90^{\circ}\)

\section*{Exercise - 4.5}
(1) i , ii
(2) No. Because there is no common arm.

\section*{Exercise - 4.6}
(1) (i) \(\angle \mathrm{AOD}, \angle \mathrm{BOC} \quad\) (ii) \(\angle \mathrm{AOD}, \angle \mathrm{DOB}\)
(2) \(\mathrm{y}=160^{\circ}\) (Vertically opposite angles) \(x+160^{\circ}=180^{\circ} \quad \therefore x=20^{\circ}\) \(\angle \mathrm{x}=\angle \mathrm{z}\) Vertically opposite angles \(\quad \therefore z=20^{\circ}\)

\section*{Exercise - 4.7}
(1)
(i) Transversal
(ii) Parallel
(iii) Parallel
(iv) one
(2)
(i) \(100^{\circ}\)
(ii) \(45^{\circ}\) (iii) \(90^{\circ}\)
(iv) \(100^{\circ}\)
(3) \(\angle \mathrm{x}=180-(75+45)=60^{\circ} ; \angle \mathrm{y}=75^{\circ} ; \mathrm{z}=45^{\circ}\)
(4)
\[
\begin{aligned}
& b+50^{\circ}=180^{\circ} \quad \therefore b=130^{\circ} \\
& b+c=180^{\circ} \Rightarrow 130^{\circ}+c=180^{\circ} \Rightarrow c=50^{\circ} \\
& d+50^{\circ}=180^{\circ} \Rightarrow \quad d=130^{\circ}
\end{aligned}
\]
(5) \(\quad l \| m\)
(6) \(\angle a=50^{\circ} \quad\) (Alternate angles)
\(\angle b=50^{\circ} \quad\) (Alternate angles)
\(\angle c=\angle d=\angle e=50^{\circ}\)
(all are Alternate angles)

\section*{05 - Triangle and its Properties}

\section*{Exercise - 5.1}
(1)
(i) Possible
(ii) Possible
(iii) Not possible
(iv) Possible

\section*{Exercise - 5.2}
(1) (i) Median
(ii) Altitude (Height)
(2) Right angle triangle
(3) Yes
(4) No, in some cases it lies in the exterior of the triangel
(5) (i) XZ
(ii) \(\angle \mathrm{R}\)
(iii) B

\section*{Exercise - 5.3}
(1)
(ii) \(60^{\circ}\)
(iii) \(40^{\circ}\)
(2) (i) \(x=70^{\circ} ; y=60^{\circ}\)
(ii) \(\mathrm{x}=80^{\circ} ; \mathrm{y}=50^{\circ}\)
(iii) \(\mathrm{x}=110^{\circ} ; \mathrm{y}=70^{\circ}\)
(iv) \(x=60^{\circ} ; y=90^{\circ}\) (v) \(x=45^{\circ} ; y=90^{\circ}\)
(iv) \(x=60^{\circ}\)
(3) (i) \(40^{\circ}\)
(ii) \(34^{\circ}\)
(iii) \(60^{\circ}\)
(4) \(60^{\circ}\)
(5) (i) False
(ii) True
(iii) False (iv) False
(6) (i) \(30^{\circ} ; 60^{\circ} ; 90^{\circ}\)
(7) \(\mathrm{x}=100^{\circ} ; \mathrm{y}=50^{\circ} ; \mathrm{z}=100^{\circ}\)
(8) \(72^{\circ}\)
(9)
\(\angle \mathrm{P}=80^{\circ} ; \angle \mathrm{Q}=40^{\circ} ; \angle \mathrm{R}=60^{\circ}\)
(10) \(18^{\circ} ; 72^{\circ} ; 90^{\circ}\)
(11) \(36^{\circ}, 54^{\circ}\)
(12) \(\angle \mathrm{LPM}=40^{\circ} ; \angle \mathrm{LMP}=50^{\circ} ; \angle \mathrm{QRP}=50^{\circ}\)
(13) \(540^{\circ}\)

\section*{Exercise - 5.4}
(1) Interior angles : \(\angle \mathrm{CBA}, \angle \mathrm{ACB}, \angle \mathrm{BAC}\); Exterior angles : \(\angle \mathrm{CBX}, \angle \mathrm{ACZ}, \angle \mathrm{BAY}\)
(2) \(\angle \mathrm{ACD}=111^{\circ}\)
(3) \(x=115^{\circ} ; y=35^{\circ}\)
(4) (i) \(x=50^{\circ}\)
(ii) \(x=33^{\circ} ; y=82^{\circ}\)
(5) \(\angle \mathrm{CDB}=76^{\circ} ; \angle \mathrm{CBD}=39^{\circ} ; \angle \mathrm{CBA}=58^{\circ}\)
(6)
(i) \(x=55^{\circ}, y=55^{\circ}\)
(ii) \(x=100^{\circ}, y=50^{\circ}\)
(iii) \(x=120^{\circ}, y=30^{\circ}\)
(iv) \(x=40^{\circ}, y=70^{\circ}\)
(v) \(x=60^{\circ} ; y=150^{\circ} ;\) (vi) \(x=50^{\circ} ; y=130^{\circ}\)
(7) \(50^{\circ} ; 75^{\circ} ; 55^{\circ}\)
(8) \(\angle \mathrm{P}=35^{\circ}\),yes
(9) \(70^{\circ}\)
(10) \(30^{\circ} ; 75^{\circ} ; 75^{\circ}\)
(11) \(x=135^{\circ} ; y=80^{\circ}\)

\section*{06 - Ratio - Applications}

\section*{Exercise - 6.1}
(1) \(100: 10,10: 1\)
(2) ₹ 15
(i) \(15: 5\) or \(3: 1\) (Radha: Sudha)
(ii) \(5: 15\) or \(1: 3\) (Sudha: Radha)
(3) \(40: 20\) or \(2: 1\)
(4) \(1: 2400\)
(5) Raju's share \(=40\); Ravi's share \(=56\)
(6) \(\overline{\mathrm{AX}}=18 \mathrm{~cm} ; \overline{\mathrm{XB}}=20 \mathrm{~cm}\).
(7) ₹ 60,000
(8) 8 liters
(9) (i) Count no. of boys and girls in your class and write inthe form of ratio. If boys or girls will be zero, can you write it in the form of ratio? We can not compare such ratios.
(ii) Count of doors and number of windows of your classroom and number write in the form of ratios.
(iii) Count all textbooks and note books with you and write in ratio form.

\section*{Exercise - 6.2}
(1) (i) 8,8
(ii) 450,450
(iii) 96,96
(iv) 6,30
(v) 24,72
(2) (i) False
(ii) True
(iii) True
(iv) True
(v) False
(3) ₹. 90
(4) 10 kg
(5) a) 45
b) 26
(6) i) \(540^{\circ}\)
ii) \(21^{\circ}\)

\section*{Exercise - 6.3}
(1) \(0.0001 \mathrm{~cm} ; 2 \mathrm{~cm}\)
(2) (i) Yes
(ii) No
(iii) No.
(3) 4 cm
(4) - Draw 5 different squares, measure their lengths and fill the table.
- 4 times of side will be perimeter of square find and fill the table.
- Square the side of each and fill the table.
(i) Yes, lenght of side is in direct proportion to perimeters of the squares.
(ii) No, length of side is not indirect proportion to area of the square.

\section*{Exercise - 6.4}
(1) School Y
(2) \(20 \%\) decrease
(3) Mangoes \(=35 \%\)
(4) \(16 \%\)
(5) Abscent \(=16 \frac{2}{3} \%\) or \(16.66 \% \quad\) Present \(=83 \frac{1}{3} \%\) or \(83.33 \%\)
(6) 7200
(7) 15
(8) gold \(70 \%\); silver \(25 \%\); Copper 5\%
(9) 2000

\section*{Exercise - 6.5}
(1) \(12 \frac{1}{2} \%\) or \(12.5 \%\)
(2) \(6 \%\)
(3) ₹ \(2,00,000\)
(4) ₹ 875
(5) loss \(=1200(2.44 \%)\)
(6) 561
(7) 202.5
(8) 800
(9) 1100

\section*{Exercise - 6.6}
(1) 2 years 8 months or \(\frac{8}{3}\) years or \(2 \frac{2}{3}\) years \(\quad\) (2) \(12 \%\)
(3) ₹. 450
(4) ₹. 12958
(5) \(1 \frac{1}{2}\) years

\section*{07 - Data Handling}

\section*{Exercise - 7.1}
(1)
(i) \(33{ }^{\circ} \mathrm{C} \quad\) (ii) \(30^{\circ} \mathrm{C}\)
(2) 15.9 kg
(3) (i) Ground nuts ₹:7500; Jawar ₹:4000; Millets ₹:5250 (ii) Ground nuts
(4) 42
(5) (i) 23
(ii) 21 , by 3
(iii) 16.5, by 4 (iv) Lekhya
(6) (i) ₹ 18
(ii) ₹ 54
(iii) ₹ 9 (iv) Proportional
(7) 5.5
(8) 5.6
(9) 107

\section*{Exercise - 7.2}
(1) \(155 \mathrm{~cm}, 140 \mathrm{~cm}\)
(2) (i) Mean \(=28\), Mode \(=27\)
(ii) 2 players of age 25 years each.
(3) 25
(4) (i) Mode
(ii) Mean
(iii) Mean
(iv) Mode

\section*{Exercise - 7.3}
(1)
(i) F (not mean, it is range)
(ii) T
(iii) F (not mode, it is mean)
(iv) F (if the numbers are even it is not)
(2) (i) ₹ 1400
(ii) ₹ 1450
(3) Mode is correct, but median is wrong.
(4) three \(1,7,10 ; 2,7,9 ; 3,7,8\)
(5) 11

\section*{Exercise - 7.4}
(5)
(i) Education
(ii) Food
(iii) ₹ 2250
(iv) ₹ 1500

\section*{08 - Congurencey of Triangles}

\section*{Exercise - 8.1}
(1)
(i) True
(ii) False, \(\mathrm{LS} \neq \mathrm{AD}\)
(2)
(i) \(\angle \mathrm{P}=\angle \mathrm{R}\)
\(\angle \mathrm{TQP}=\angle \mathrm{RQS}\)
\(\angle \mathrm{T}=\angle \mathrm{S}\)
(3)
(ii) Correct
(4) Yes (S.S.S. Congruency)

\section*{Exercise - 8.2}
(1) It is to be given that \(\mathrm{GH}=\mathrm{TR}\) and \(\mathrm{HJ}=\mathrm{TS}\)
(2) \(\mathrm{AP}=4 \mathrm{~km}(\therefore \mathrm{AP}=\mathrm{BQ}\) c.p.c.t. \()\)
(3)
(i) \(\Delta \mathrm{ABC} \cong \triangle \mathrm{STR}\)
\(\mathrm{AB}=\mathrm{ST}\) also \(\mathrm{BC}=\mathrm{TR}\)
(ii) \(\Delta \mathrm{POQ} \cong \Delta \mathrm{ROS}\)
\(\angle \mathrm{A}=\angle \mathrm{S} \quad \angle \mathrm{B}=\angle \mathrm{T}\)
\(\mathrm{AC}=\mathrm{SR} \quad \angle \mathrm{C}=\angle \mathrm{R} \quad \angle \mathrm{POQ}=\angle \mathrm{ROS} \quad \angle \mathrm{Q}=\angle \mathrm{S}\)
(iii) \(\Delta \mathrm{DRO} \cong \triangle \mathrm{OWD}, \mathrm{DR}=\mathrm{OW}\) also \(\mathrm{DO}=\mathrm{OD}\)
\[
\begin{aligned}
& \mathrm{RO}=\mathrm{WD} \quad \angle \mathrm{ODR}=\angle \mathrm{DOW} \\
& \angle \mathrm{R}=\angle \mathrm{W} \quad \angle \mathrm{ROD}=\angle \mathrm{WOD} \\
& \text { in the fig } \square \mathrm{WORD} \\
& \angle \mathrm{R}=90^{\circ} \\
& \mathrm{WD}=\mathrm{OR} \text { and } \mathrm{WO}=\mathrm{DR}
\end{aligned}
\]
\(\therefore \square\) WORD is a rectangle
\(\therefore \Delta \mathrm{WSD} \cong \triangle \mathrm{RSO}\)
\(\Delta \mathrm{WSO} \cong \triangle \mathrm{RSD}\)
also \(\Delta \mathrm{ORW} \cong \triangle \mathrm{DWR}\)
(iv) \(\triangle \mathrm{ABC}\) and \(\triangle \mathrm{CDA}\) not congruent
(4) (i) In \(\triangle A B C\) and \(\triangle R Q P\) we need to know that \(A B=R Q\).
(ii) In \(\triangle A B C\) and \(\triangle A D C\) we need to know that \(A B=A D\).

\section*{Exercise - 8.3}
(1)
(i) ByA.A.S. \(\quad \triangle \mathrm{ABC} \cong \triangle \mathrm{RPQ}\)
(ii) By A.A.S. or ASA \(\triangle \mathrm{ABD} \cong \triangle \mathrm{CDB}\)
(iii) By A.A.S. or A.S.A. \(\triangle \mathrm{AOB} \cong \triangle \mathrm{DOC}\) (iv) not congruent
(2) (i) \(\triangle \mathrm{ABC} \cong \triangle \mathrm{DCB} \quad\) (A.A.S)
(ii) Because \(\triangle \mathrm{ABC} \cong \triangle \mathrm{DCB}\) (A.A.S.), therefore \(\mathrm{AB}=\mathrm{CD}\) (c.p.c.t.) (Corresponding Parts of Congruent Triangles)
\(\therefore \triangle \mathrm{AOB} \cong \triangle \mathrm{DOC}\)
otherwise \(\triangle \mathrm{AOB}\) and \(\triangle \mathrm{DOC}\) are similar by A.A.A.
in congruent triangles corresponding parts are equal.

\section*{Exercise - 8.4}
(1)
(i) S.S.S.
(ii) S.A.S. (iii) A.S.A
(iv) R.H.S.
(2) (i) a) \(\mathrm{AR}=\mathrm{PE}\)
b) \(\mathrm{RT}=\mathrm{EN}\)
c) \(\mathrm{AT}=\mathrm{PN}\)
(ii) a) \(\mathrm{RT}=\mathrm{EN}\)
b) \(\mathrm{PN}=\mathrm{AT}\)
(iii) a) \(\angle \mathrm{A}=\angle \mathrm{P}\)
b) \(\angle T=\angle N\)
(3)
(i) Side
(ii) Angle
(iii) Common side
(iv) S.A.S.
(4) We can't say \(\triangle \mathrm{ABC} \cong \triangle \mathrm{PQR}\) when the corresponding angles are equal, but can say that the triangles are simlar.
(5) \(\Delta \mathrm{RAT} \cong \Delta \mathrm{WON} \quad\) (6) \(\Delta \mathrm{ABC} \cong \triangle \mathrm{ABT}\) and \(\Delta \mathrm{QRS} \cong \Delta \mathrm{TPQ}\)
(7) (i) Draw two triangles with same measures. (ii) Draw two triangles of different measures.
(8) \(\mathrm{BC}=\mathrm{QR}\) (A.S.A.) or \(\mathrm{AB}=\mathrm{PQ}\) (A.A.S.) or \(\mathrm{AC}=\mathrm{PR}\) (A.A.S.)
(9) \(\angle \mathrm{B}=\angle \mathrm{E} ; \angle \mathrm{A}=\angle \mathrm{F}\) by A.A.S. \(\triangle \mathrm{ABC} \cong \triangle \mathrm{FED}\) are congruent ; \(\mathrm{BC}=\mathrm{ED}\)

\section*{10 - Algebraic Expressions}

\section*{Exercise - 10.1}
(1)
(i) \(3 n\)
(ii) \(2 n\)
(2) (i) • In fig. 4 number of coloured tiles will be 4 on each side.
- In fig. 5 number of coloured tiles will be 5 on each side.
(ii)Algebraic expression for the pattern \(=4 \mathrm{n} ; 4,8,12,16,20 \ldots \ldots\) expression \(=4 \mathrm{n}\)
(iii) Algebraic expression for the pattern \(=4 n+1 ; 9,13,17,21 \ldots\)... expression \(=4 n+1\)
(3)
(i) \(p+6\)
(ii) \(x-4\)
(iii) \(y-8\)
(iv) \(-5 q\)
(v) \(y \div 4\) or \(\frac{y}{4}\)
(vi) \(\frac{1}{4}\) of \(p q\) or \(\frac{p q}{4}\)
(vii) \(3 z+5\)
(viii) \(10+5 x\)
(ix) \(2 y-5\)
(x) \(10 y+13\)
(4) (i) ' 3 more than \(x\) ' or 3 is added to \(x\) (ii) 7 is substracted from ' \(y\) '
(iii) \(l\) is multiplied by 10 (iv) \(x\) is divided by 5
(v) \(m\) is multiplied by 3 and added to 11
(vi) \(y\) is multiplied by 2 and subtracted 5 or 5 is subtracted from 2 times of \(y\).
(5)
(i) Constant
(ii) Variable
(iii) Constant
(iv) Variable

\section*{Exercise - 10.2}
(1)
(i) \(\left(a^{2},-2 a^{2}\right)\)
(ii) \((-y z, 2 z y)\)
(iii) \(\left(-2 x y^{2}, 5 y^{2} x\right)\)
(iv) \((7 p,-2 p, 3 p)\) and \((8 p q,-5 p q)\)
(2) Algebaric expression : ProblemNumbers : i, ii, iv, vi, vii,ix, xi

Numerical expression: Problem Numbers : iii, v , viii, x
(3) Monomial i, iv, vi ; binomial: ii, v, vii ; trinomial: iii, viii, ix, multinomial: \(x\)
(4)
(i) 1
(ii) 3
(iii) 5
(iv) 4

\section*{LEARNING OUTCOMES}

\section*{WATHEMATICS}

\section*{CLASS 7}

\section*{The learner....}
- Solves problems involving four fundamental operations on integers.
- Solves problems related to daily life situations involving fractions, rational numbers and decimals.
- Uses exponential form of the numbers to simplify problems involving multiplication and division of large numbers.
- Solves problems in daily life related to profit-loss, interest by using percentage and ratio.
- Solves problems in daily life involving linear equations in one variable.
- Demonstrates the types of angles formed by intersections of any two lines.
- Explains the properties of angles formed in and outside of a triangle.
- Explains congruency of triangles on the basis of the information given about them(like SSS, SAS, ASA, RHS).
- Using ruler and a pair of compasses constructs triangles with given measurements.
Finds the areas of parallelogram, triangle, and rhombus.
Estimates the value of pi.
Calculates mean, median and mode of the ungrouped data of daily life.
Idéntifies 3D shapes like sphere, cube, cuboids, cylinder and
cone in real life situations and prepares net shapes to them.
EExplains line symmetry, rotationah symmetry and point symmetry.

\section*{INSTRUCTIONS TO TEACHERS}

\section*{Dear Teachers!!}

Greetings and a hearty welcome to the newly developed textbook Mathematics for class VII.
- The present textbook is developed as per the syllabus and Academic standards conceived by the mathematics position paper prepared based on SCF - 2011 and RTE - 2009 for Upper Primary stage of education.
- The new textbook constitutes 15 chapters with concepts from the main branches of mathematics like Arithemetics, Algebra, Geometry, Mensuration and Statistics.
- These chapters emphasize the prescribed academic standards in achieving the skills like Problem Solving, Reasoning-proof, Communication, Connectivity and representation. The staratagies in building a chapter are observation of patterns, making generalization through deductive, inductive and logical thinking, exploring different methods for problem solving, questioning, interaction and the utilization of the same in daily life.
- The situations, examples and activities given in the textbook are based on the competencies acquired by the child at Primary Stage. So the child participates actively in all the classroom interactions and enjoys learning of Mathematics.
- Primary objective of a teacher is to achieve the "Academic standards" by involving students in the discussions and activities suggested in the textbook and making them to learn the concepts.
- Mere completion of a chapter by the teacher doesn't make any sense. The exhibition of prescribed academic standards by the student only ensures the completion of the chapter.
- Students are to be encouraged to answer the questions given in the chapters. These questions help to improve logical, inductive and deductive thinking of the child.
- Understanding and generalization of properties are essential. Student first finds the need and then proceeds to understand, followed by solving similar problems on his own and then generalises the facts. The strategy in the presentation of concepts followed.
- Clear illustrations and suitable pictures are given wherever it was found connection and corrects the misconnection necessary.
- Exercises of ‘Do This' and 'Try This' are given extensively after completion of each concept. Exercises given under 'Do This' are based on the concept taught. After teaching of two or three concepts some exercises are given based on them. Questions given under 'Try This' are intended to test the skills of generalization of facts, ensuring correctness of statements, questioning etc., 'Do This' exercise and other exercises given are supposed to be done by students on their own. This process helps the teacher to know how far the students can fare with the concepts they have learnt. Teacher may assist in solving problem given in 'Try This' sections.
- Students should be made to digest the concepts given in "looking back" completely. The next chapter is to be taken up by the teacher only after satisfactory performance by the students in accordance with the academic standards designated for them (given at the end).
- Teacher may prepare his own problems related to the concepts besides solving the problems given in the exercises. Moreover students should be encouraged to identify problems from day- to-day life or create their own.
- Above all the teacher should first study the textbook completely thoroughly and critically. All the given problems should be solved by the teacher well before the classroom teaching.
- Teaching learning strategies and the expected learning outcomes, have been developed class wise and subject-wise based on the syllabus and compiled in the form of a Hand book to guide the teachers and were supplied to all the schools. With the help of this Hand book the teachers are expected to conduct effective teaching learning processes and ensure that all the students attain the expected learning outcomes.

\section*{Syllabus}

Number System: ( 50 hrs )
1. Integers
2. Fractions,

Decimals \&

\section*{Rational}

Numbers

Algebra
(20 hrs)
11. Exponents
10. Algebraic Expressions
3. Simple Equations

\section*{(i) Integers}
- Multiplication and division of integers (through patterns).
- Properties of integers (including identities for addition \& multiplication, (closure, commutative, associative, inverse, distributive) (through patterns). (examples from whole numbers as well). Expressing properties in a general form. Construction of counter examples, (eg. subtraction is not commutative).
- Word problems involvingintegers (all operations)
(ii) Fractions, Decimals and rationalnumbers:
- Multiplication of fractions
- Fraction as an operator "of"
- Reciprocal of a fraction and its use
- Division of fractions
- Word problems involving mixed fractions (related to daily life)
- Introduction to rational numbers (with representation on number line)
- Difference between fraction and rational numbers.
- Representation of rationalnumber as a decimal.
- Word problems on rationalnumbers (all operations)
- Multiplication and division of decimal fractions
- Conversion of units (length \& mass)
- Word problems (including all operations)

Exponents and powersIntroduction Meaning of x in \(\mathrm{a}^{\mathrm{x}}\) where a ह́ Z
- Laws of exponents (throughobserving patterns to arrive at5 generalization.)whereM, \(n \in N\) (i) \(a^{m} a^{n}=a^{m+n}(\) ii \() ?\left(a^{m}\right)^{? n}=a^{m n}\) (iii) \(a^{m} / a^{n}=\) \(\mathrm{a}^{\mathrm{m}-\mathrm{n}}\), where \((\mathrm{m}-\mathrm{n}) \in \mathrm{N}(\mathrm{iv}) \mathrm{a}^{\mathrm{m}} \cdot \mathrm{b}^{\mathrm{m}}=(\mathrm{ab})^{\mathrm{m}}(\mathrm{v})\) number with exponent zerovi)Decimal number in exponential notation vii) Expressing large number in standard form (Scientific Notation)
ALGEBRAIC EXPRESSIONSIntroduction Generate algebraic expressions(simple) involving one or two variables
- Identifying constants, coefficient, powers
- Like and unlike terms, degree of expressions e.g., \(x^{2} y\) etc.(exponentd \(\leq 3\), number of variables \(\mathrm{d} \leq 2\) )
- Addition, subtraction of algebraic expressions (coefficients should be integers).

\section*{Simple equations}
- Simple linear equations in one variable (in contextual problems) with two operations (integers as coefficients)

\section*{Academic Standards}

Problem - Organization of raw data into classified data. \\
Solving & \begin{tabular}{l} 
Solves the problems for finding the Mean, Medium, Mode \\
of ungrouped data
\end{tabular} \\
Reasoning & \begin{tabular}{l} 
Understands the Mean, Mode and Medium of ungrouped \\
data and what they represent.
\end{tabular} \\
Communication:- Explains the Mean, Mode and Medium for ungrouped data. \\
Connections: - Understands the usage of Mean, Mode and Medium in daily \\
life situation problems.
\end{tabular} \\
\hline
\end{tabular}
